The AS-level topology is too coarse for complex networking problems

The building-level topology captures rich semantics of peering interconnections

Motivation

- Increase traffic flow transparency

- Assessment of resilience of peering interconnections

- Diagnose congestion or DoS attacks

- Inform peering decisions

- Elucidate the role of colocation facilities, carrier hotels, and Internet exchange points (IXPs)

Challenges

- IP addresses are logical and region-independent

- BGP does not encode geographic information

- Existing methods are accurate for city-level granularity, not for finer granularities:
  - Delay-based
  - Hostname heuristics
  - Database-driven

What buildings do we need to consider for locating peering interconnections?

□ **Interconnection facilities**: special-purpose buildings used to co-locate routing equipment
What buildings do we need to consider for locating peering interconnections?

☐ **Interconnection facilities**: special-purpose buildings used to co-locate routing equipment

Key Intuition 1: To locate a peering interconnection, search the facilities where the peers are present

# Develop a map of interconnection facilities

- ☐ Compile a list of interconnection facilities and their address
- ☐ Map ASes and IXPs to facilities
- ☐ Public data sources:
  - ☐ PeeringDB
  - ☐ AS/IXP websites

| April 2015	
Facilities	1,694
ASes	3,303
AS-facility connections	13,206
IXPs	368
IXP-facility colocations	783

# Interconnection facilities are concentrated in hub cities

Complexity of peering interconnections

Complexity of peering interconnections

Key Intuition 2: The different peering interconnection types can be used as constrains in the facility search

Constrained Facility Search (CFS)

For a target peering interconnection ASA- ASB:

- ☐ Step 1: Identify the type of peering interconnection
- ☐ Step 2: Initial facility search
- ☐ Step 3: Constrain facilities through alias resolution
- ☐ Step 4: Constrain facilities by repeating steps 1-3 with follow-up targeted traceroutes
- ☐ Step 5: Facility search in the reverse direction
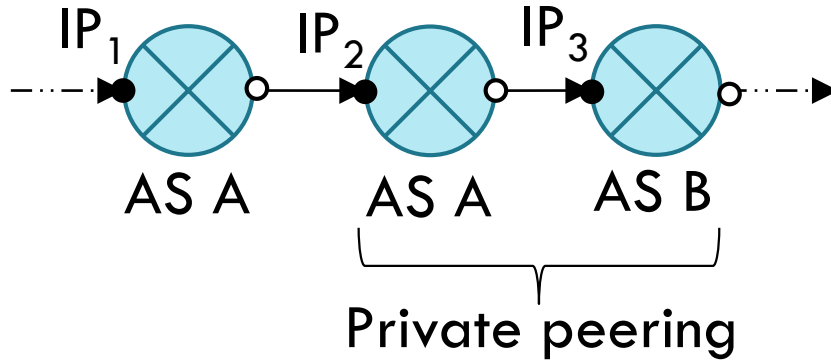

Constrained Facility Search (CFS)
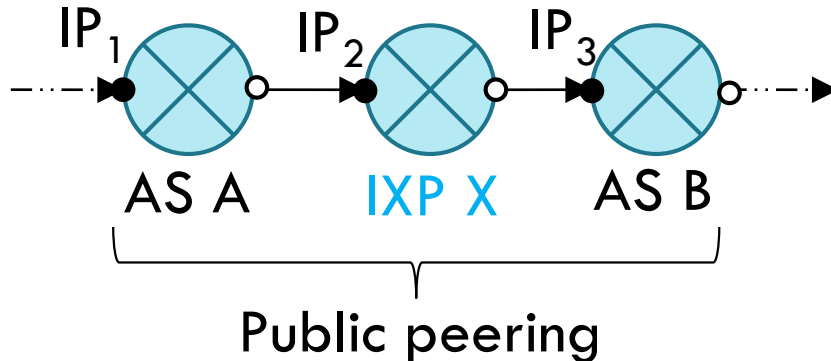

For a target peering interconnection ASA- ASB:

☐ Step 1: Identify the type of peering interconnection

☐ Step 2: Initial facility search

☐ Step 3: Constrain facilities through alias resolution

☐ Step 4: Constrain facilities by repeating steps 1-3 with follow-up targeted traceroutes

☐ Step 5: Facility search in the reverse direction

Identifying the peering type

Facility search between the facilities of the peering Ases

Facility search between the IXP and the peering ASes

Constrained Facility Search (CFS)

For a target peering interconnection ASA- ASB:

- ☐ Step 1: Identify the type of peering interconnection
- ☐ Step 2: Facility search
- ☐ Step 3: Constrain facilities through alias resolution
- ☐ Step 4: Constrain facilities by repeating steps 1-3 with follow-up targeted traceroute
- ☐ Step 5: Facility search in the reverse direction
Facility search: single common facility

IP$_{A1}$ IP$_{X1}$ IP$_{B1}$

AS A   IXP X   AS B

Near end peer   Far end peer
	Facilities	
AS A	F1	F2
IXP X	F4	F2

□ The common facility is inferred as the location of the interface of the peer at the near end

Facility search: single common facility

IP_{A1} IP_{X1} IP_{B1}

AS A IXP X AS B

Near end peer Far end peer

	Facilities	
AS A	F1	F2
IXP X	F4	F2

IP_{A1} facility

☐ The common facility is inferred as the location of the interface of the peer at the near end
Facility search: no common facility

	Facilities	
AS A	F1	F2
IXP X	F4	F3

□ No inference possible

◻ Incomplete facility dataset or remote peering

◻ Run algorithm in [Castro 2014] to detect remote peering

◻ Run traceroutes changing the target peering links

Castro et al. "Remote Peering: More Peering without Internet Flattening." CoNEXT 2014

Facility search: multiple common facilities

IP$_{A1}$ IP$_{X1}$ IP$_{B1}$

AS A IXP X AS B

Near end peer Far end peer
	Facilities		
AS A	F1	F2	F5
IXP X	F4	F2	F5

☐ Possible facilities are constrained but no inference yet

Facility search: multiple common facilities

IP$_{A1}$ IP$_{X1}$ IP$_{B1}$

AS A   IXP X   AS B

Near end peer   Far end peer

	Facilities		
AS A	F1	F2	F5
IXP X	F4	F2	F5

Possible IP$_{A1}$ facilities

☐ **Possible facilities are constrained but no inference yet**
Constrained Facility Search (CFS)

For a target peering interconnection ASA- ASB:

☐ Step 1: Identify the type of peering interconnection

☐ Step 2: Initial facility search

☐ Step 3: Derive constrains through alias resolution

☐ Step 4: Constrain facilities by repeating steps 1-3 with follow-up targeted traceroutes

☐ Step 5: Facility search in the reverse direction

Derive constrains through alias resolution

Trace 1 — IP_{A1} (AS A) → IP_{X1} (IXP X) → IP_{B1} (AS B)

	Facilities		
AS A	F1	F2	F5
IXP X	F4	F2	F5

Possible IP_{A1} facilities

Trace 2 — IP_{A2} (AS A) → IP_{C1} (AS C)

Near end peer   Far end peer

	Facilities		
AS A	F1	F2	
AS C	F1	F2	

Possible IP_{A2} facilities

F5

□ Parse additional traceroutes containing peering interconnections of the peer at the near end

# Derive constrains through alias resolution

Facilities

AS A	F1	F2	F5
AS C	F1	F2	F3

Constrained Facility Search (CFS)

For a target peering interconnection ASA- ASB:

☐ Step 1: Identify the type of peering interconnection

☐ Step 2: Initial facility search

☐ Step 3: Constrain facilities through alias resolution

☐ Step 4: Constrain facilities by repeating steps 1-3 with follow-up targeted traceroutes

☐ Step 5: Facility search in the reverse direction

Follow-up CFS iterations
	Facilities			
AS A	F1		F2	F5
IXP X	F4		F2	F5

- ☐ **If CFS has not converged to a single facility:**
  - ☐ Execute a new round of traceroutes with different set of targets
  - ☐ Repeat steps 1-3 (a CFS iteration)
- ☐ **'Clever' selection of the new traceroute targets can help CFS to narrow down the facility search**

Traceroute target selection
Facilities

AS A	F1	F2	F5
IXP X	F4	F2	F5

Facilities

AS A	F1	F2	F5
IXP X	F4	F2	F5

Traceroute target selection
	Facilities		
AS A	F1	F2	F5
IXP X	F4	F2	F5

	Facilities		
AS A	F1	F2	F5
IXP X	F4	F2	F5

Targeting public peerings over the same IXP offers no additional constrains because CFS still compares the same sets of facilities

Traceroute target selection

Trace 1 — IP_{A1} — AS A — IP_{X1} — IXP X — IP_{B1} — AS B

Facilities			
AS A	F1	F2	F5
IXP X	F4	F2	F5

Trace 3 — IP_{A4} — AS A — IP_{E1} — AS E
Facilities			
AS A		F1	F2	F5
AS E	F9	F1	F2	F5

Traceroute target selection
	Facilities		
AS A	F1	F2	F5
IXP X	F4	F2	F5

	Facilities		
AS A		F1	F2 F5
AS E	F9	F1	F2 F5

Targeting private peers or IXPs with presence in all the possible facilities for IP_{A1} does not offer additional constrains

Traceroute target selection
Traceroute target selection
Targeting peers or IXPs with presence in **at least one but not in all** the possible facilities for IP_{A1} can offer additional constrains (depending on alias resolution)

Constrained Facility Search (CFS)

For a target peering interconnection ASA- ASB:

- Step 1: Identify the type of peering interconnection
- Step 2: Initial facility search
- Step 3: Constrain facilities through alias resolution
- Step 4: Constrain facilities by repeating steps 1-3 with follow-up targeted traceroutes
- Step 5: Facility search in the reverse direction

Facility inference for the far-end peer
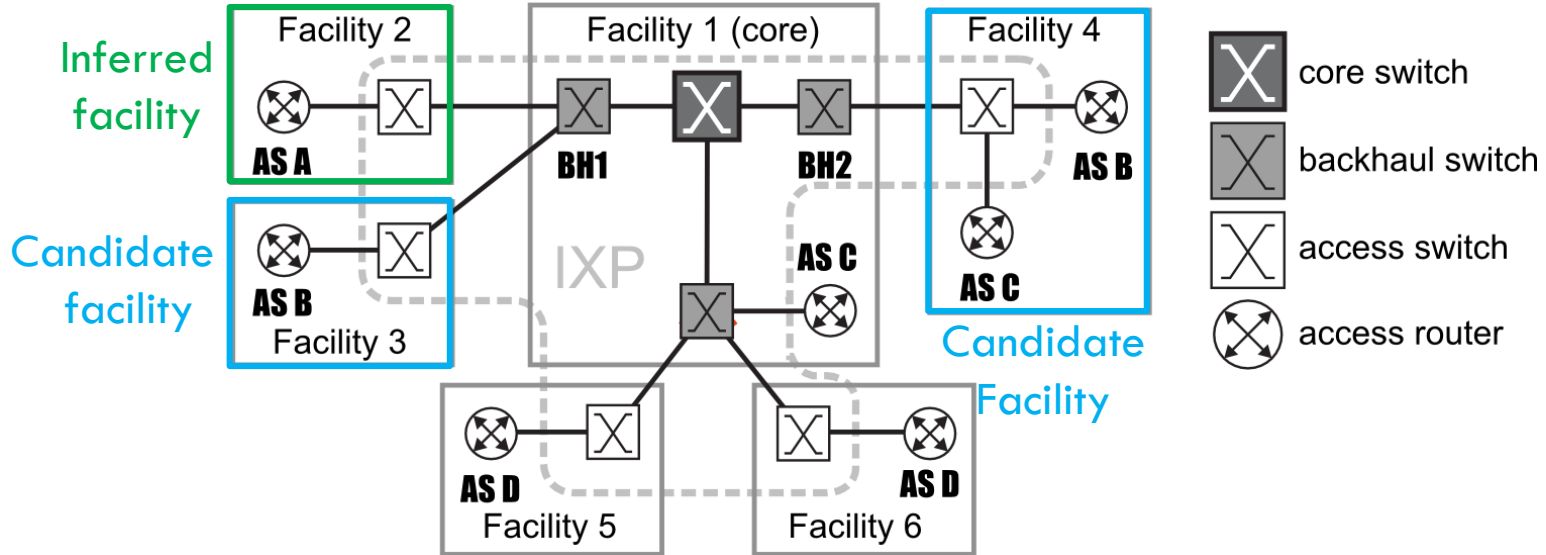

Facility 2 ✓   Facility 3 or Facility 4 ❓
- Facility search for the peer at the far-end may not converge to a single facility
- Last resort: switch proximity heuristic

Switch proximity heuristic

□ Projecting the facilities on the IXP topology can help us reason about the actual facility of the peer at the far end
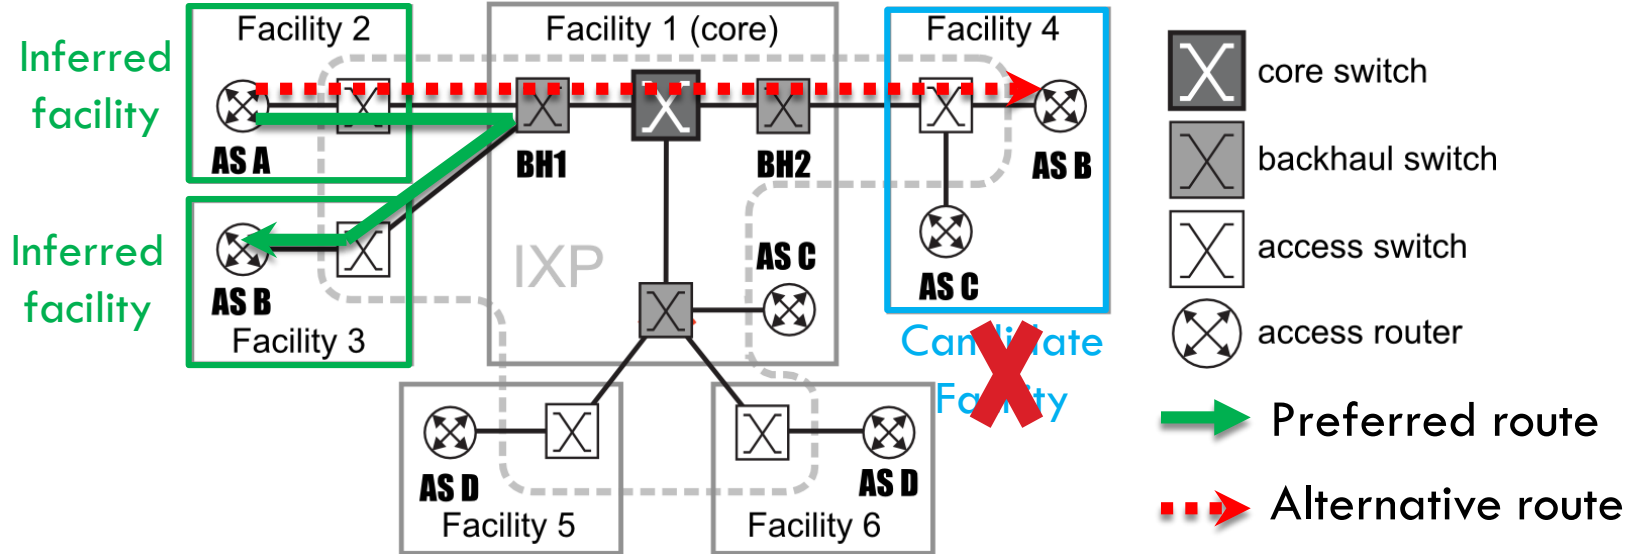

Switch proximity heuristic

□ IXPs prefer to exchange traffic over the backhaul switches instead of the core if possible

Switch proximity heuristic

□ We infer the facility of the far-end peer to be the one most proximate to the facility of the near-end peer

Evaluation

- Targeted the peerings of 5 CDNs and 5 Tier-1 ASes:
  - Google (AS15169), Yahoo (AS10310), Akamai (AS20940), Limelight (AS22822), Cloudflare (AS13335)
  - NTT (AS2914), Cogent (AS174), Deutsche Telekom (AS3320), Level 3 (AS3356), Telia (AS1299)
  - Queried one active IP per prefix for each of their peers
- Executed 100 iterations of the CFS algorithm

Collecting traceroute paths

□ Combine traceroute platforms to maximize coverage:

   □ Active: RIPE Atlas, Looking Glasses (LGs)

   □ Archived: CAIDA Ark, iPlane

|	RIPE Atlas	LGs	iPlane	Ark	Total Unique
VPs	6,385	1,877	147	107	8,517
ASNs	2,410	438	117	71	2,638
Countries	160	79	35	41	170

CFS inferred the facility for 70% of collected peering interfaces
10% of the inferences validated to 90% correctness

Ongoing and future work

□ Extend the facility dataset

    ▫ Collaborate with the operational community

    ▫ Utilize third-party datasets e.g. UW Internet Atlas[1]

□ Combine geolocation methods to further constrain facilities in unresolved cases

□ Integrate CFS with CAIDA's Ark and Sibyl[2]

Conclusions

- ☐ Constrained Facility Search (CFS) maps peering interconnections to facilities based on public data:
  - ☐ Traceroute paths
  - ☐ Interconnection facility maps
- ☐ Evaluated CFS for 5 large CDNs and Tier-1 Ases
  - ☐ Pinpoint 70% of collected IP interfaces
  - ☐ Validated 10% of inferences to ~90% correctness

Additional results
ASes and IXPs are present at multiple facilities
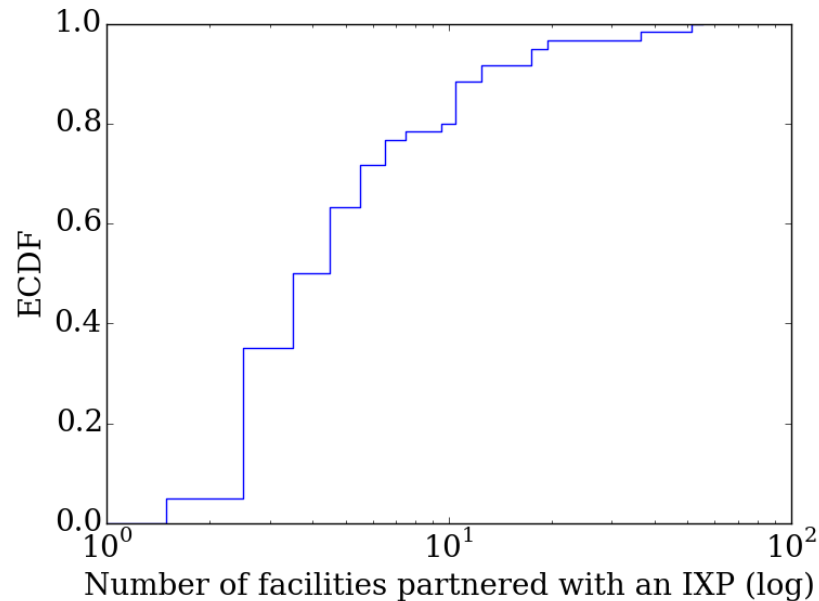

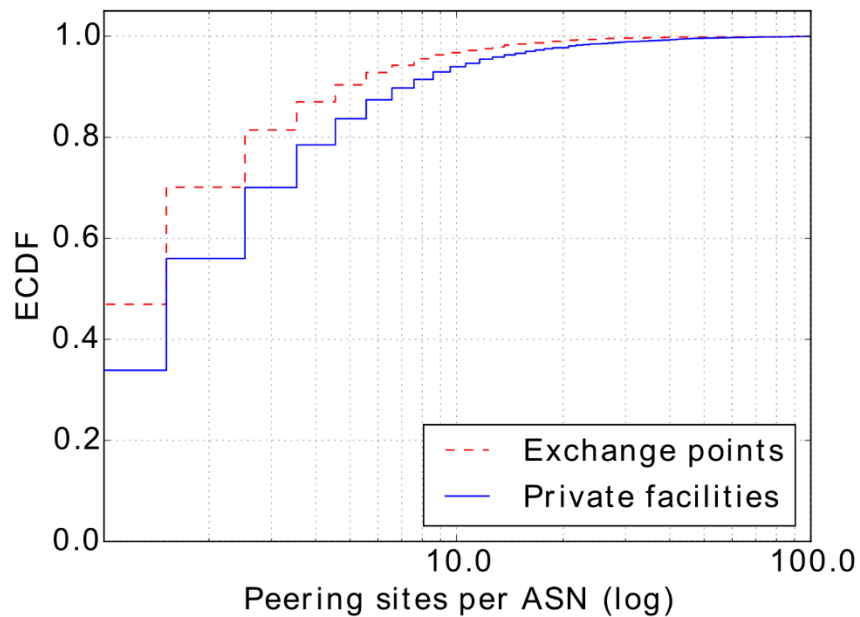

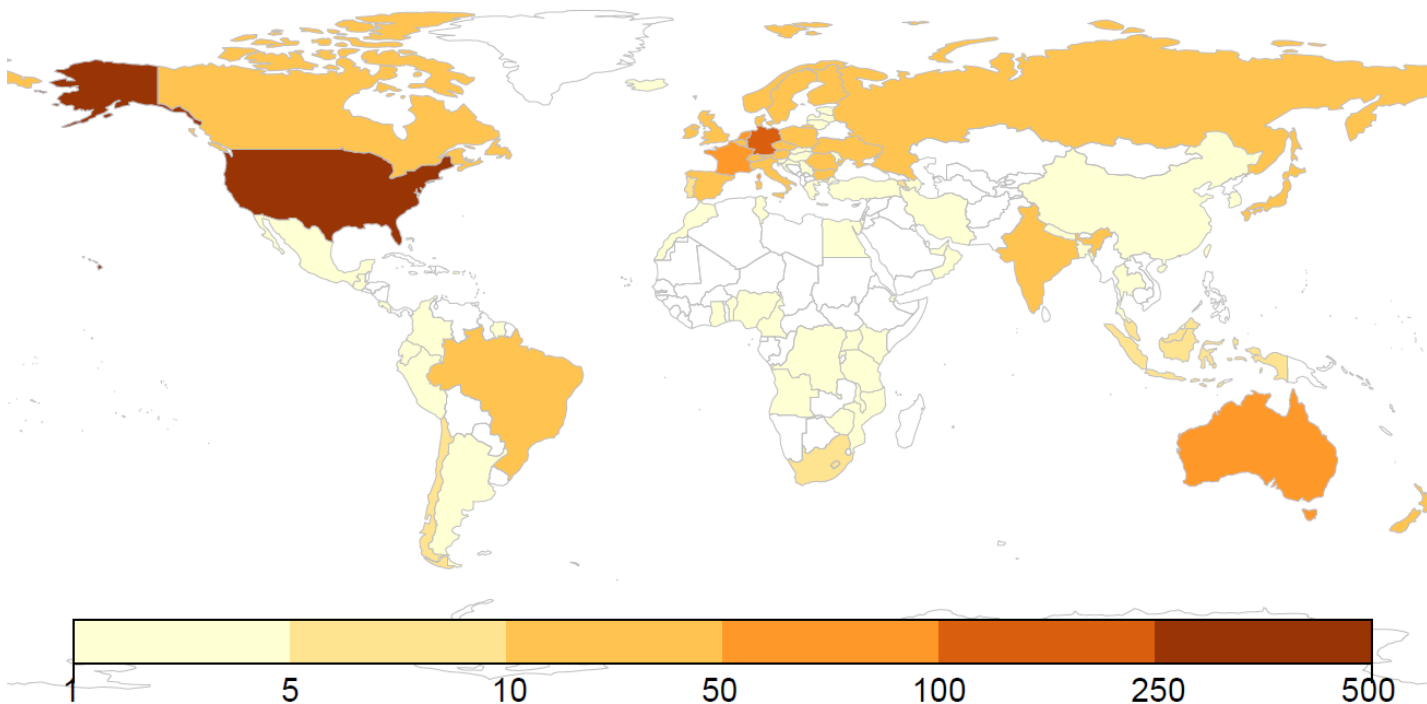

Facility data in PeeringDB are incomplete

- We compared the facility information between PDB and NOCs for 152 ASes:
  - 2,023 AS-to-facility connections in PDB
  - 1,424 AS-to-facility connections missing from PDB involving 61 ASes

Majority of interconnection facilities are located in Europe and North America

| April 2015	
Europe	860
North America	503
Asia	143
Oceania	84
South America	73
Africa	31

Diverse peering strategies between CDNs and Tier-1 ASes

Missing facility data affect the completeness of CFS inferences
