

# Software Systems for Surveying Spoofing Susceptibility

**Matthew Luckie**, Ken Keys, Ryan Koga,  
Bradley Huffaker, Robert Beverly, kc claffy

<https://spoofer.caida.org/>

IIJ, November 21st 2017

# What is the Problem?

- Lack of filtering allows anonymous denial of service attacks.
- Example: CloudFlare reports **400Gbps attacks** on their systems through 2016

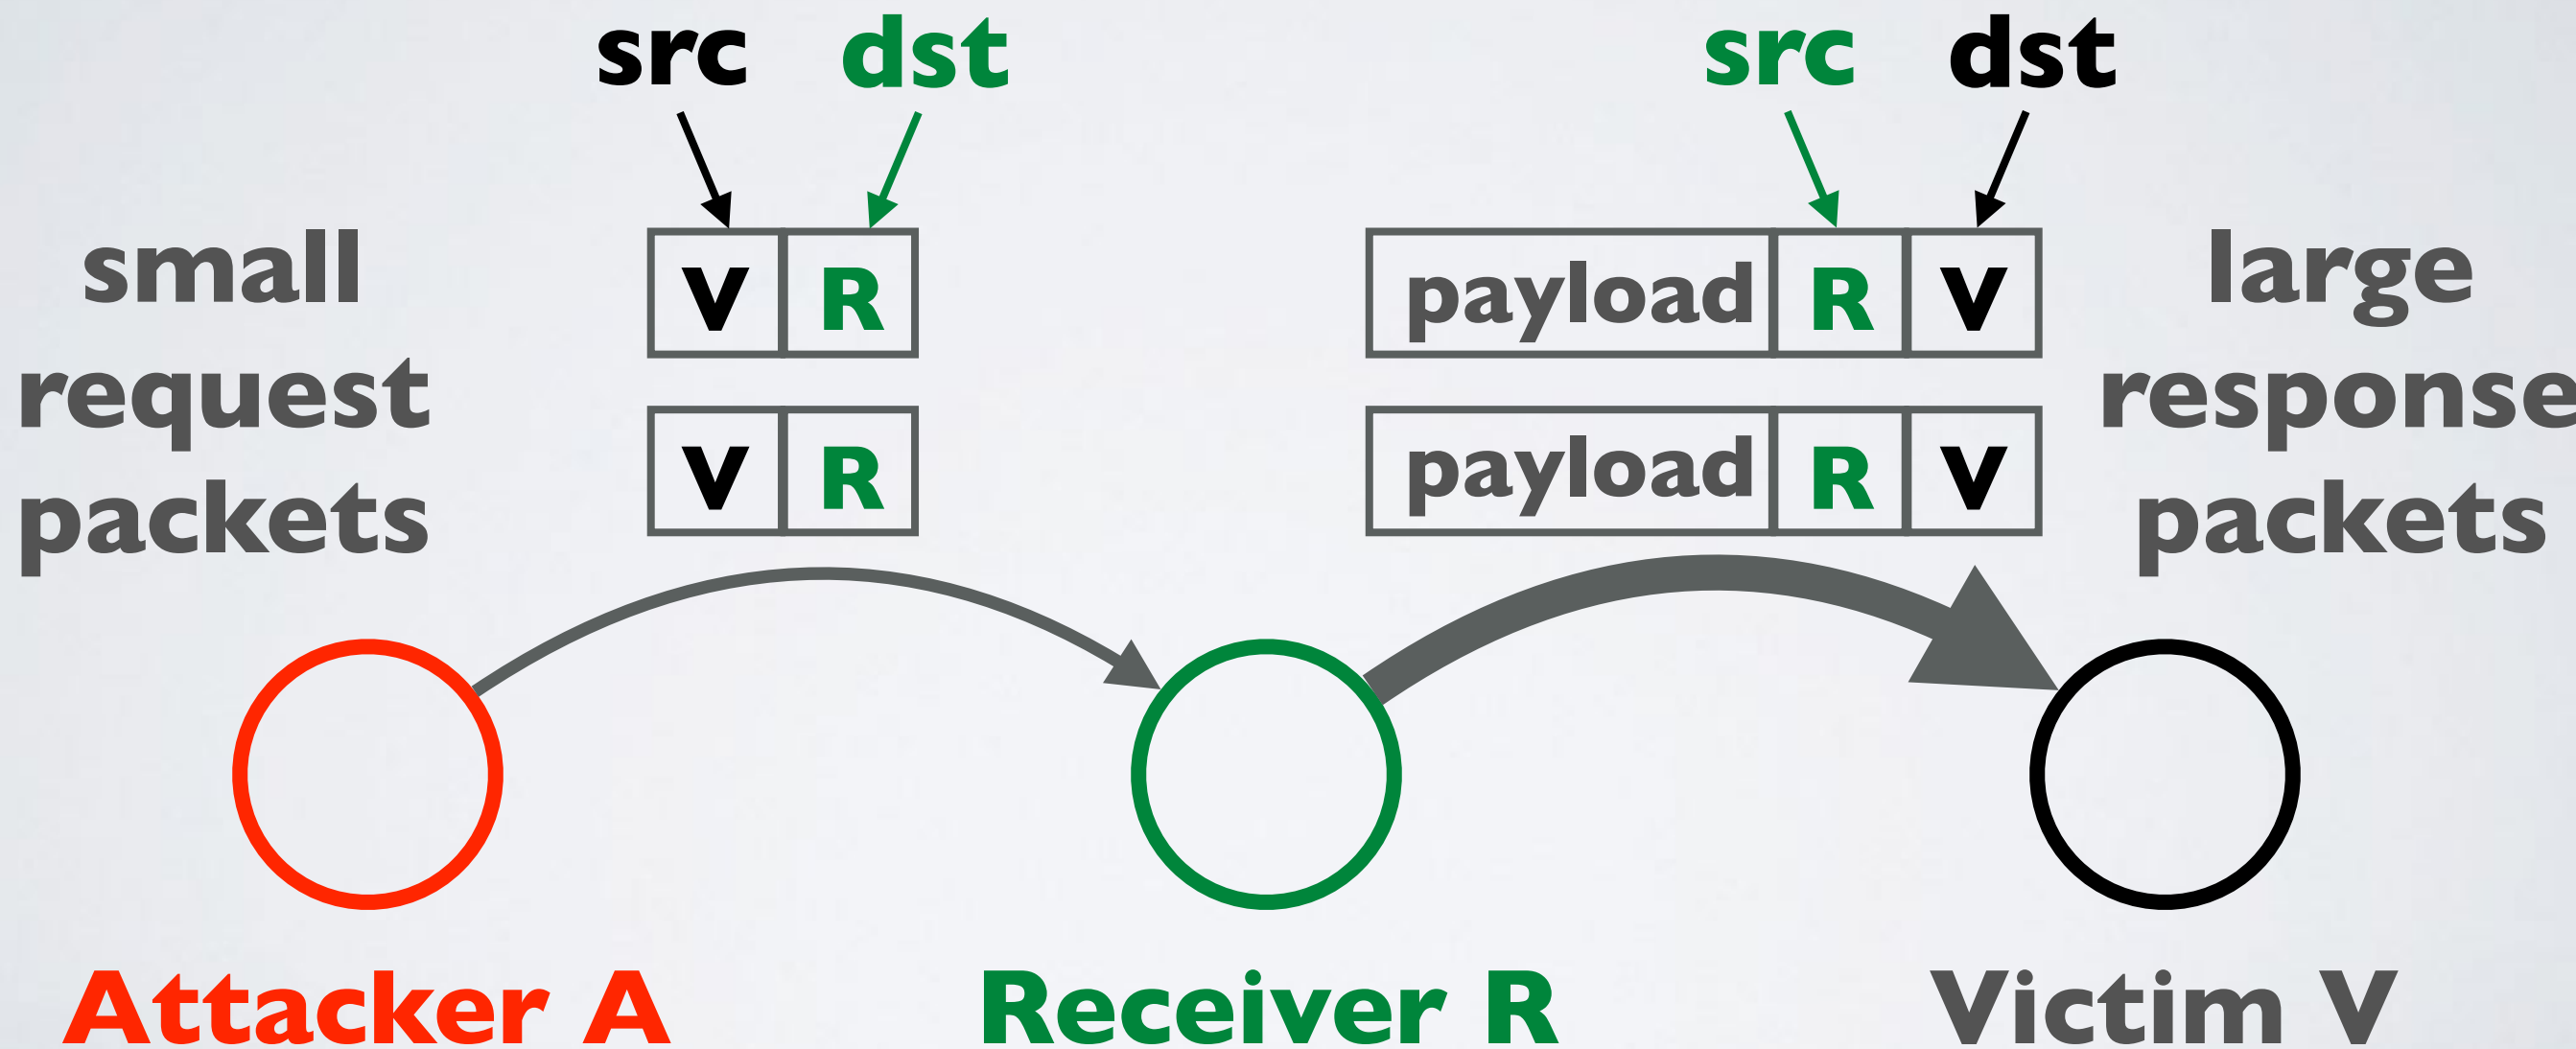

# What is the Problem?

- Lack of filtering allows anonymous denial of service attacks.
- Example: CloudFlare reports **> 1K DoS attack events** on their systems, per day, starting **Feb 2016**

# Why does spoofing matter?

- Attacker sends packet with spoofed source IP address
- Receiver cannot always know if packet's source is authentic

Volumetric Reflection-Amplification Attack

# Defenses

- **BCP38**: Network ingress filtering: defeating denial of service attacks which employ IP Source Address Spoofing
  - <https://tools.ietf.org/html/bcp38>
  - May 2000
- **BCP84**: Ingress filtering for multi-homed networks
  - <https://tools.ietf.org/html/bcp84>
  - March 2004
- Not always straightforward to deploy “source address validation” (SAV): BCP84 provides advice how to deploy

# Tragedy of the Commons

- Deploying source address validation is **primarily for the benefit of other networks**
- **Incentive not clear for some networks**
  - majority of networks do seem to deploy filtering
  - filtering gives an operator moral high-ground to pressure other networks to deploy, which does benefit the operator
  - “Cyber Insurance” takes into account security practice of the network: [QuadMetrics.com](https://www.quadmetrics.com)
- ISOC [RoutingManifesto.org](https://www.routingmanifesto.org): Mutually Agreed Norms for Routing Security (MANRS)

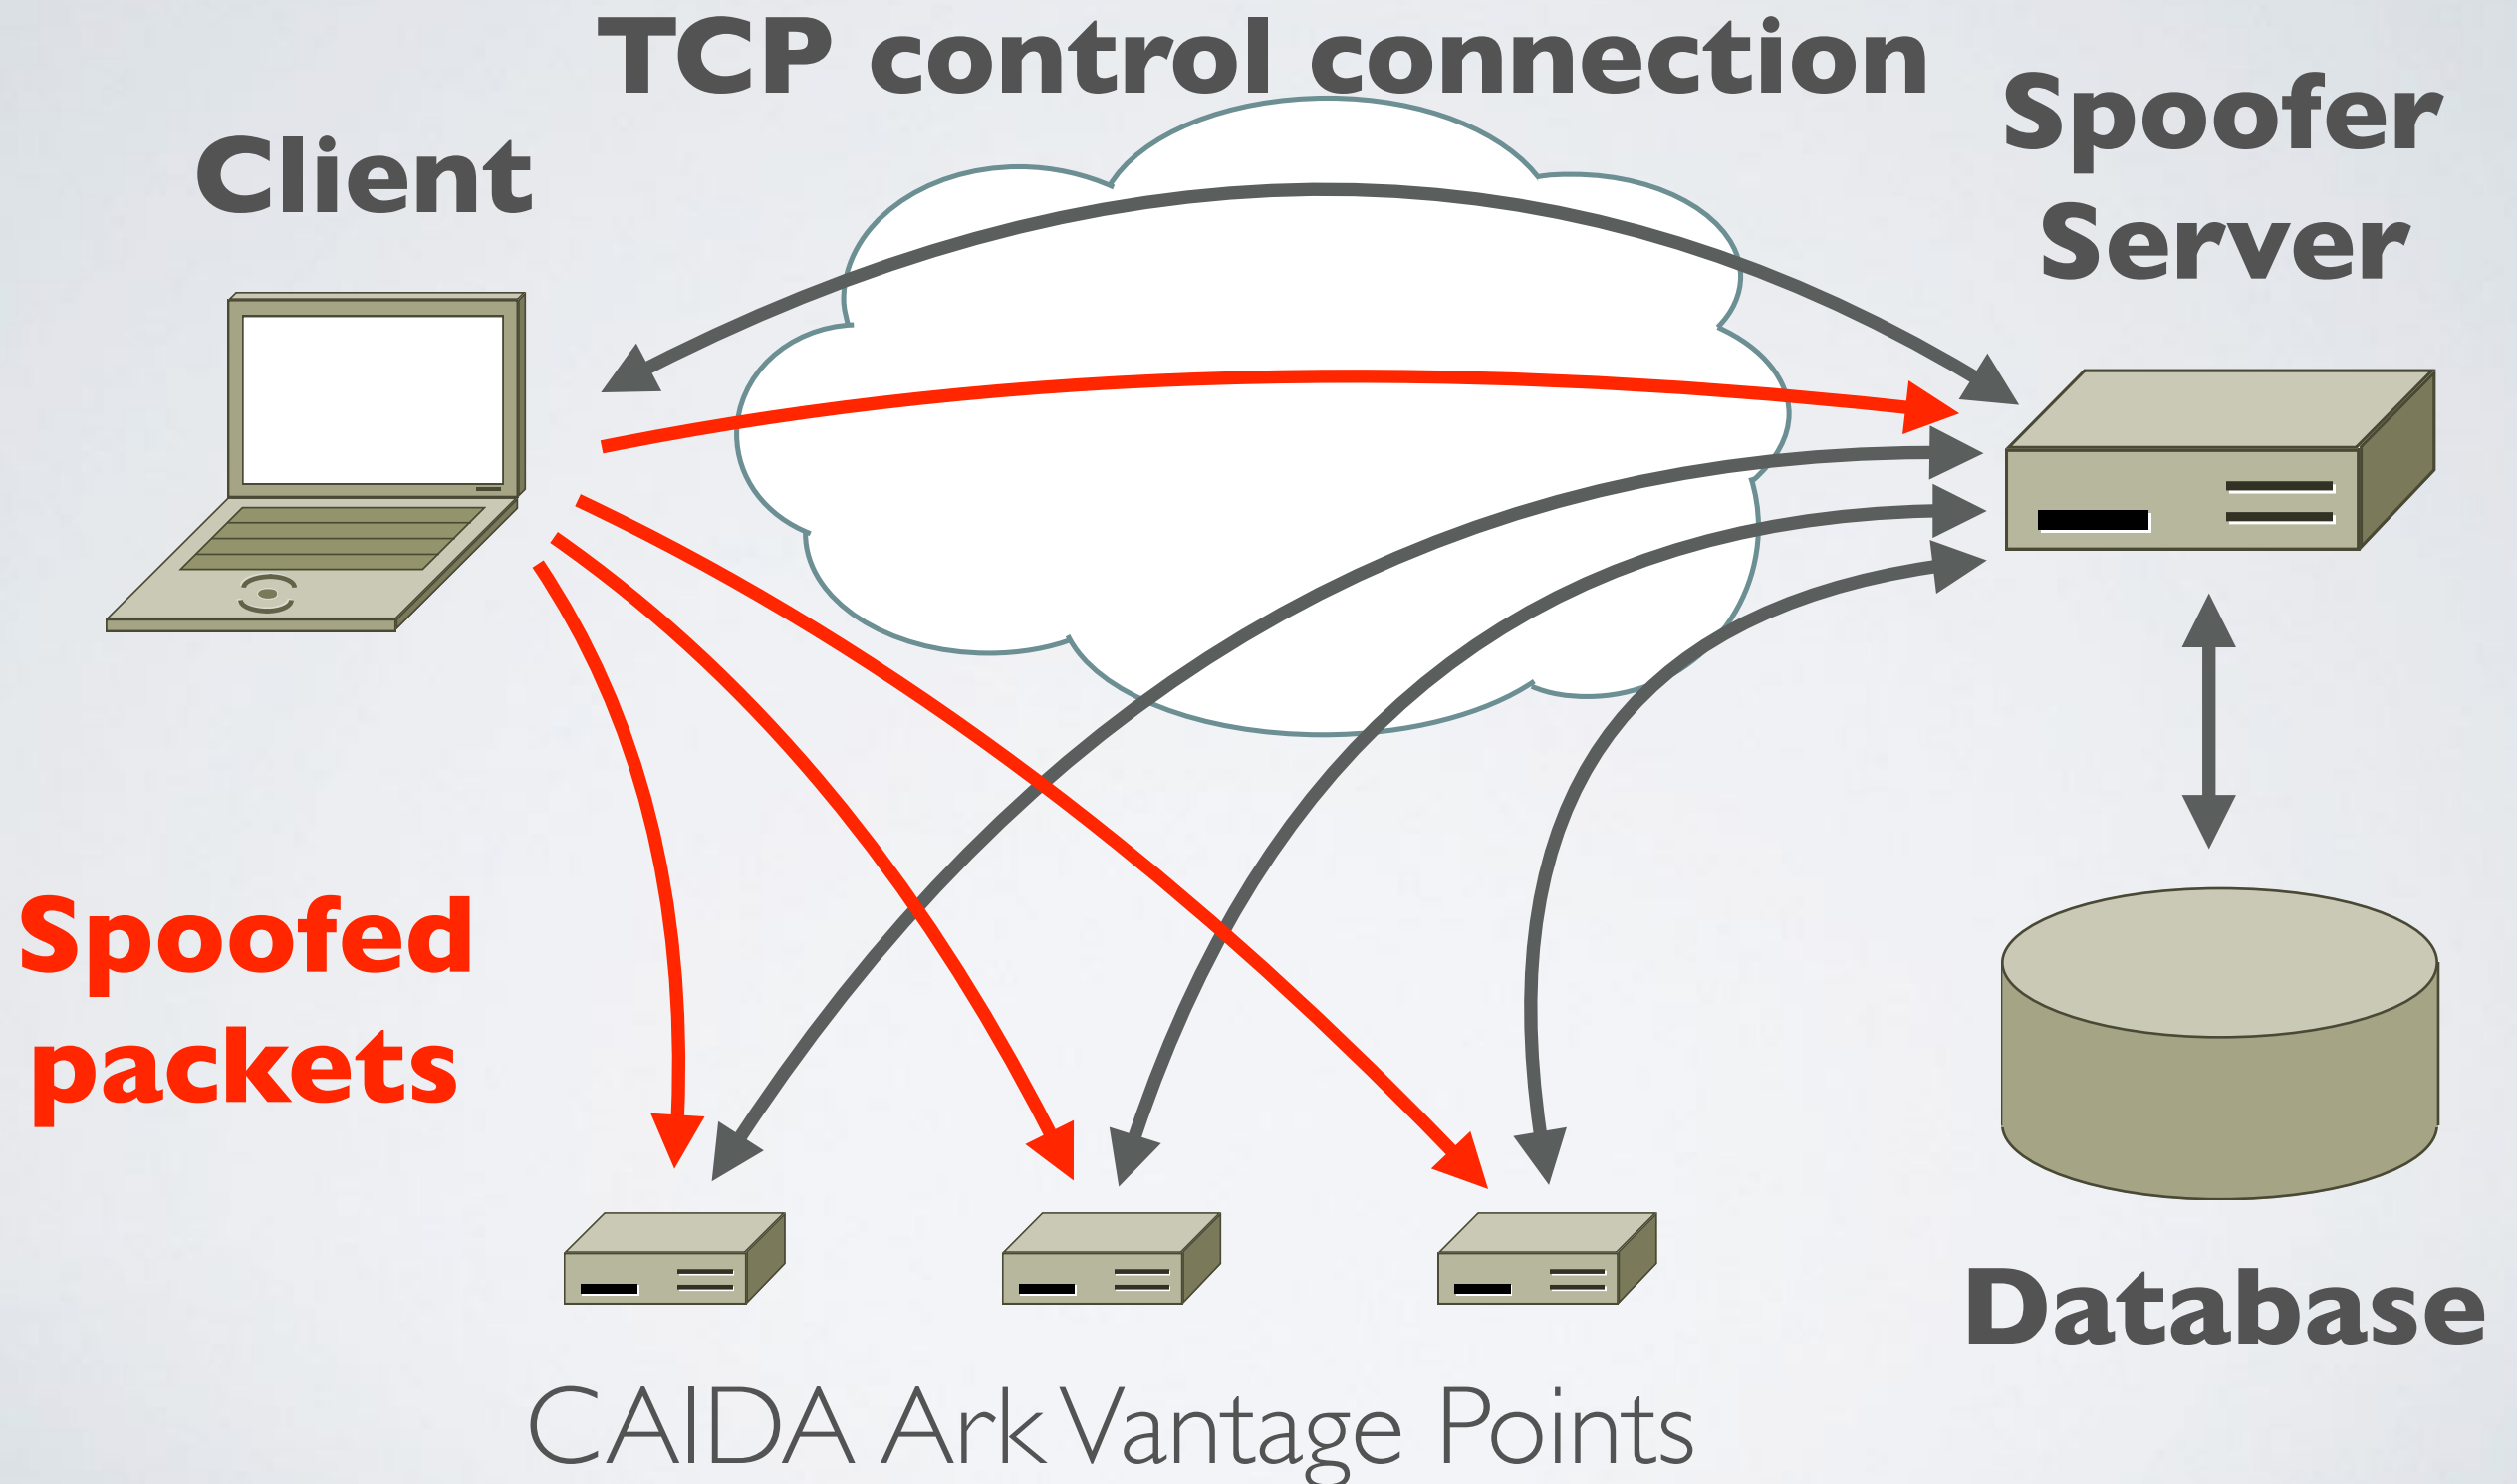

# Which networks have deployed filtering?

- **No public data that allows a network to show that they have (or have not) deployed filtering**
- **OpenResolverProject**: allows detection of which networks have not deployed filtering based on DNS request forwarding
  - requires a buggy open resolver
  - public reporting at network and AS level
- **MIT/CMAND Spoofer Project**: aggregate statistics of spoofability based on crowd-sourced tests
  - user had to manually run tests
  - no public reporting at network or AS level

# Spoofers: Client/Server Overview

# Spoofers: Client/Server Overview

- Client tests ability to spoof packets of different types
  - Routed and Private
  - IPv4 and IPv6
  - Ingress and Egress
- **traceroute** to infer forward path to destinations
- **tracefilter** to infer first location of filtering in a path
  - traceroute but with spoofed packets
- Filtering prefix granularity: how many addresses in the same network prefix can be spoofed?

# CAIDA Spoofer Project: New Features

- **Client/Server** system provides new useful features
  - opt-in to publicly share anonymized results, and opt-in to share unanonymized results for remediation
  - Runs in background, automatically testing new networks the host is attached to, once per week, IPv4 and IPv6
  - GUI to browse test results from your host, and schedule tests
  - Speed improvements through parallelized probing

[https://spoofer.caida.org/recent\\_tests.php](https://spoofer.caida.org/recent_tests.php)

# CAIDA Spoofer Project: New Features

- **Reporting Engine** publicly shows outcomes of sharable tests
  - Allows users to select outcomes
    - **per country**: which networks in a country need attention?
    - **per ASN**: which subnets need attention?
    - **per provider**: which of my BGP customers can spoof?
  - What address space does an AS announce, or could act as transit for? Is that address space stable?
    - Useful for deploying ACLs

C++

# Client/Server Deployment

- Since releasing new client in May 2016, increasing trend of more tests (yellow line)
  - Benefit of system running in background

Able to break down by country, perhaps useful for regional CERTs. In this case US-CERT

NATs behave differently:  
 Some may block spoofed traffic  
 Some uselessly rewrite  
 Some do not rewrite and pass spoofed packets

Some networks may have deployed IPv4 filtering, but forgotten to deploy IPv6 filtering

# Notifications and Remediation

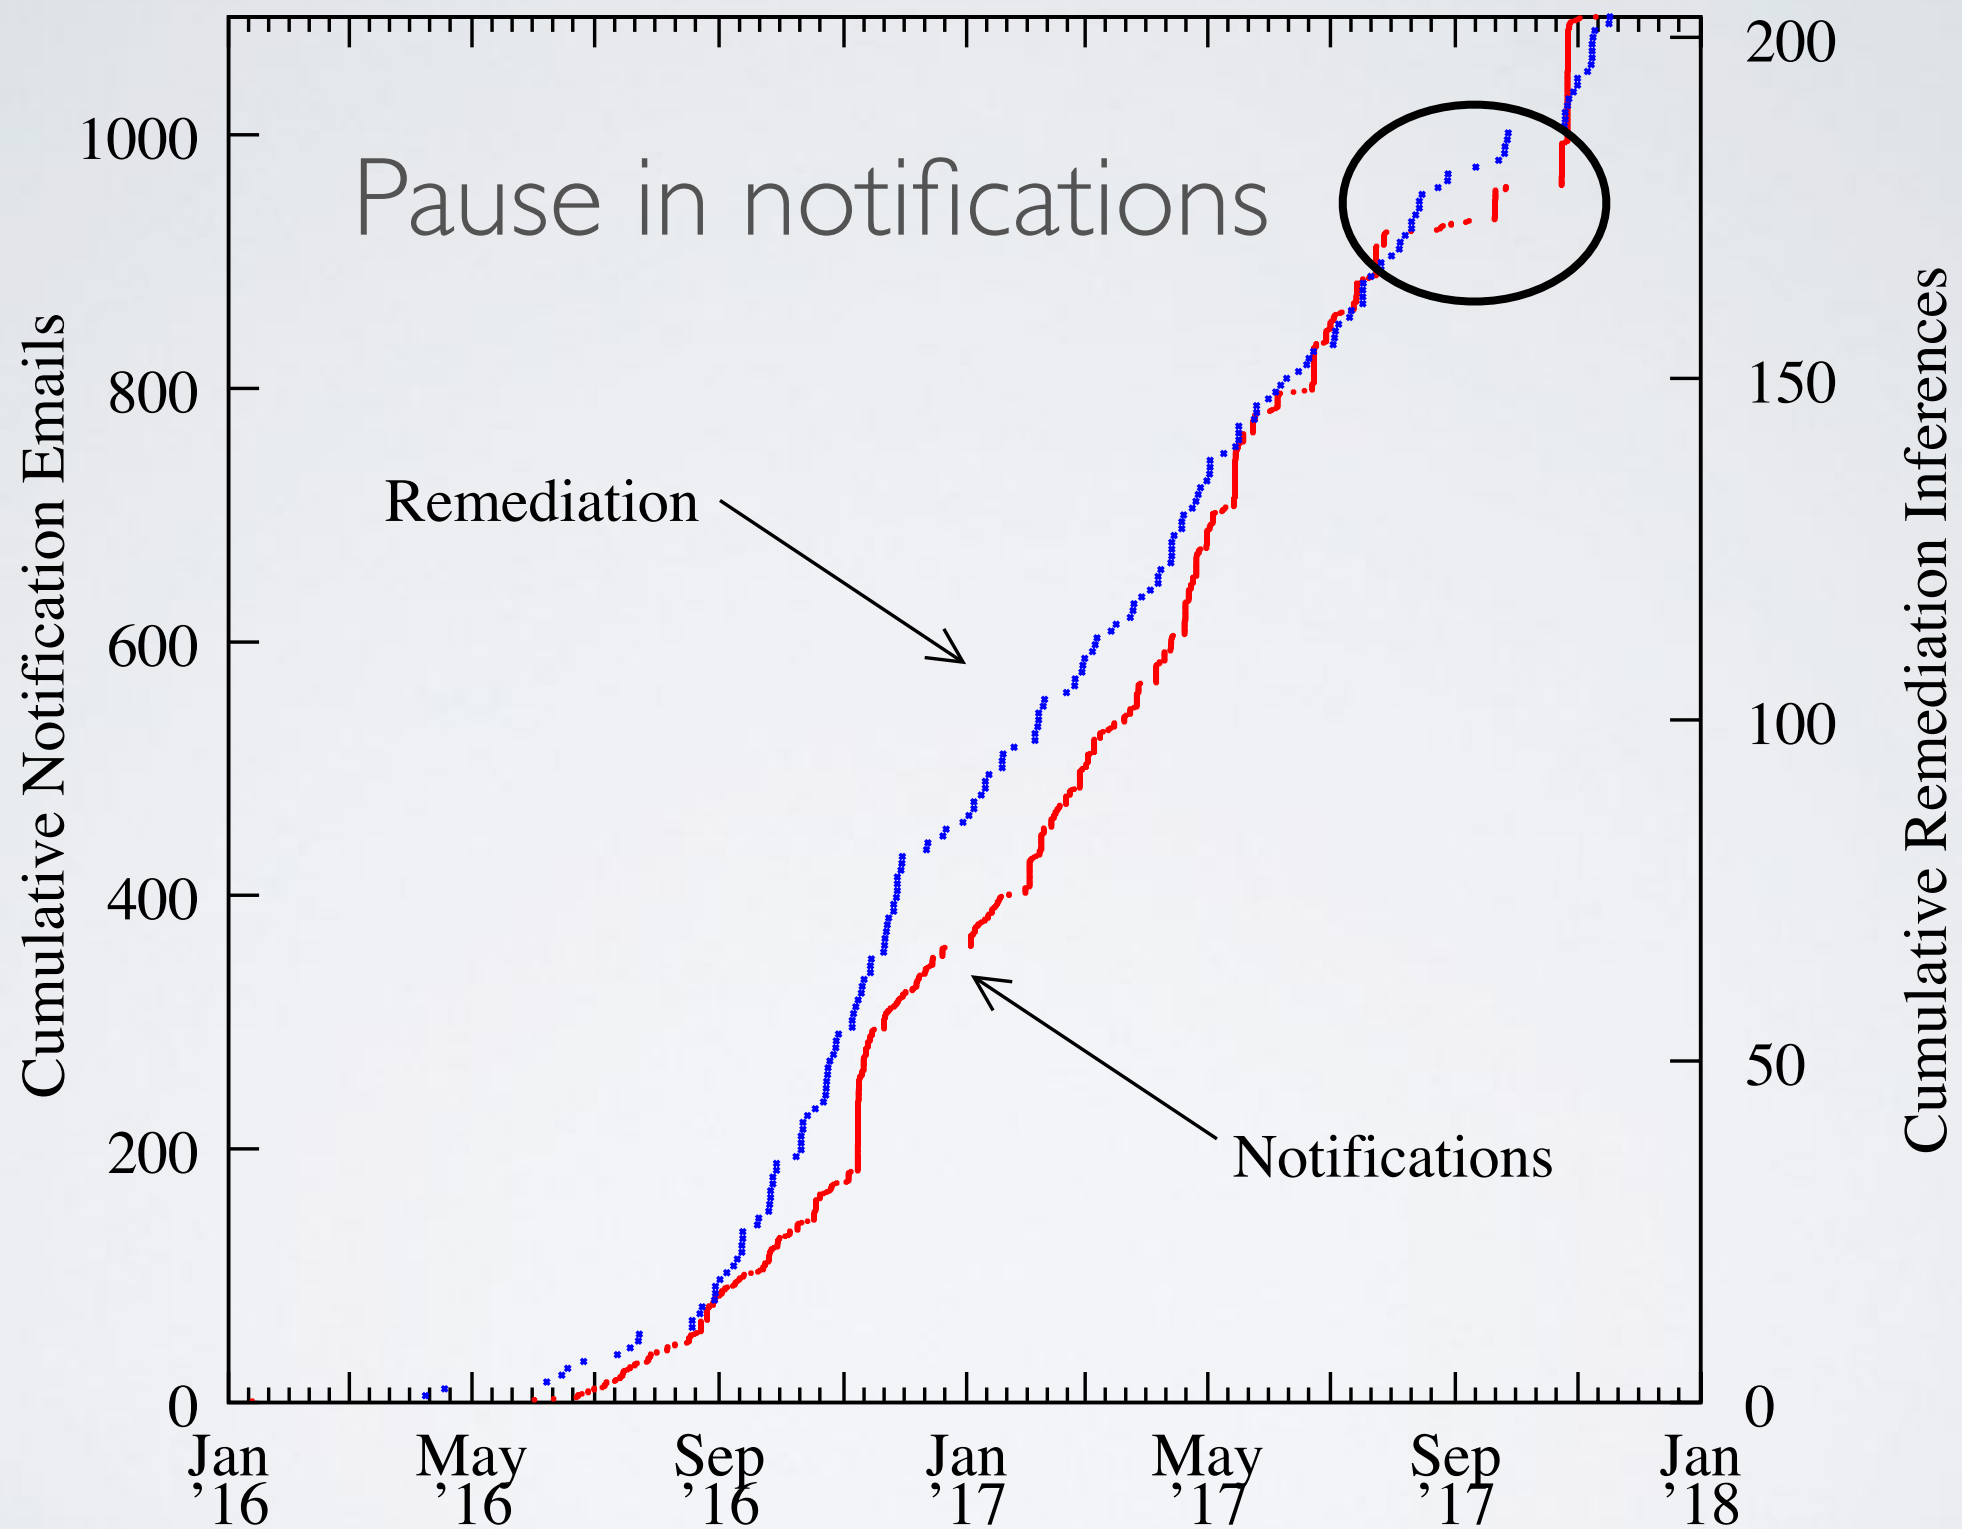

- Currently, we (Matthew) manually send notifications to abuse contacts of prefixes from which we received spoofed packet

Session	Timestamp	Client IP	ASN	Country	NAT	Spoof Private	Spoof Routable	v4 Adjacency Spoofing	Results

# Notifications and Remediation

Sent 1061 private notifications, 203 remediation inferences

# Delay from Notification to Remediation

# Practicality of Ingress Access Lists

ACLs are “the most bulletproof solution when done properly”, and the “best fit ... when the configuration is not too dynamic, .. if the number of used prefixes is low”. - BCP84

During 2015, ~5% and ~3% of ASes announced different IPv4 and IPv6 address space month-to-month, respectively.

Source: Routeviews and RIPE RIS data

# Practicality of Ingress Access Lists

*ACLs are the “best fit ... when the configuration is not too dynamic, .. if the number of used prefixes is low”. - BCP84*

In August 2016, 86.9% of stub ASes would require an IPv4 ACL of no more than 4 prefixes. More than half of IPv4 ACLs defined in January 2012 would still be unchanged today.

Source: Routeviews and RIPE RIS data

# Should I install the client?

- **Yes!**

- Room full of laptops and people who travel (use different networks). Great opportunity to collect new users and grow visibility of filtering deployment practice
- What about NAT?
  - Not all NAT systems filter packets with spoofed source addresses
  - Roughly 35% of test results that showed spoof-ability were conducted from behind a NAT

# Summary

- **Reporting Engine** publicly shows outcomes of sharable tests, ~6K unique IPs in hundreds of ASNs per month.
  - Allows users to select outcomes
    - **per country**: which networks in a country need attention?
    - **per ASN**: which subnets need attention?
    - **per provider**: which of my BGP customers can spoof?
  - Allows operators to view address space announced by an AS announce, or could act as transit for, over time.
  - Please install and use the system!
