# Need: what is the problem?

- Lack of filtering allows anonymous denial of service attacks.
- Example: Akamai reported 1.3Tbps attack on their systems March 2018 (spoofed packets -> memcached amplification).
- Soon, thousands of attacks per day. Here we go again..
  - <https://krebsonsecurity.com/2018/03/powerful-new-ddos-method-adds-extortion/>
  - <https://medium.com/@qratorlabs/the-memcached-amplification-attack-reaching-500-gbps-b439a7b83c98>

# Need: Why does spoofing matter?

- Attacker sends packet with spoofed source IP address
- Receiver cannot always know if packet's source IP is authentic

Volumetric Reflection-Amplification Attack

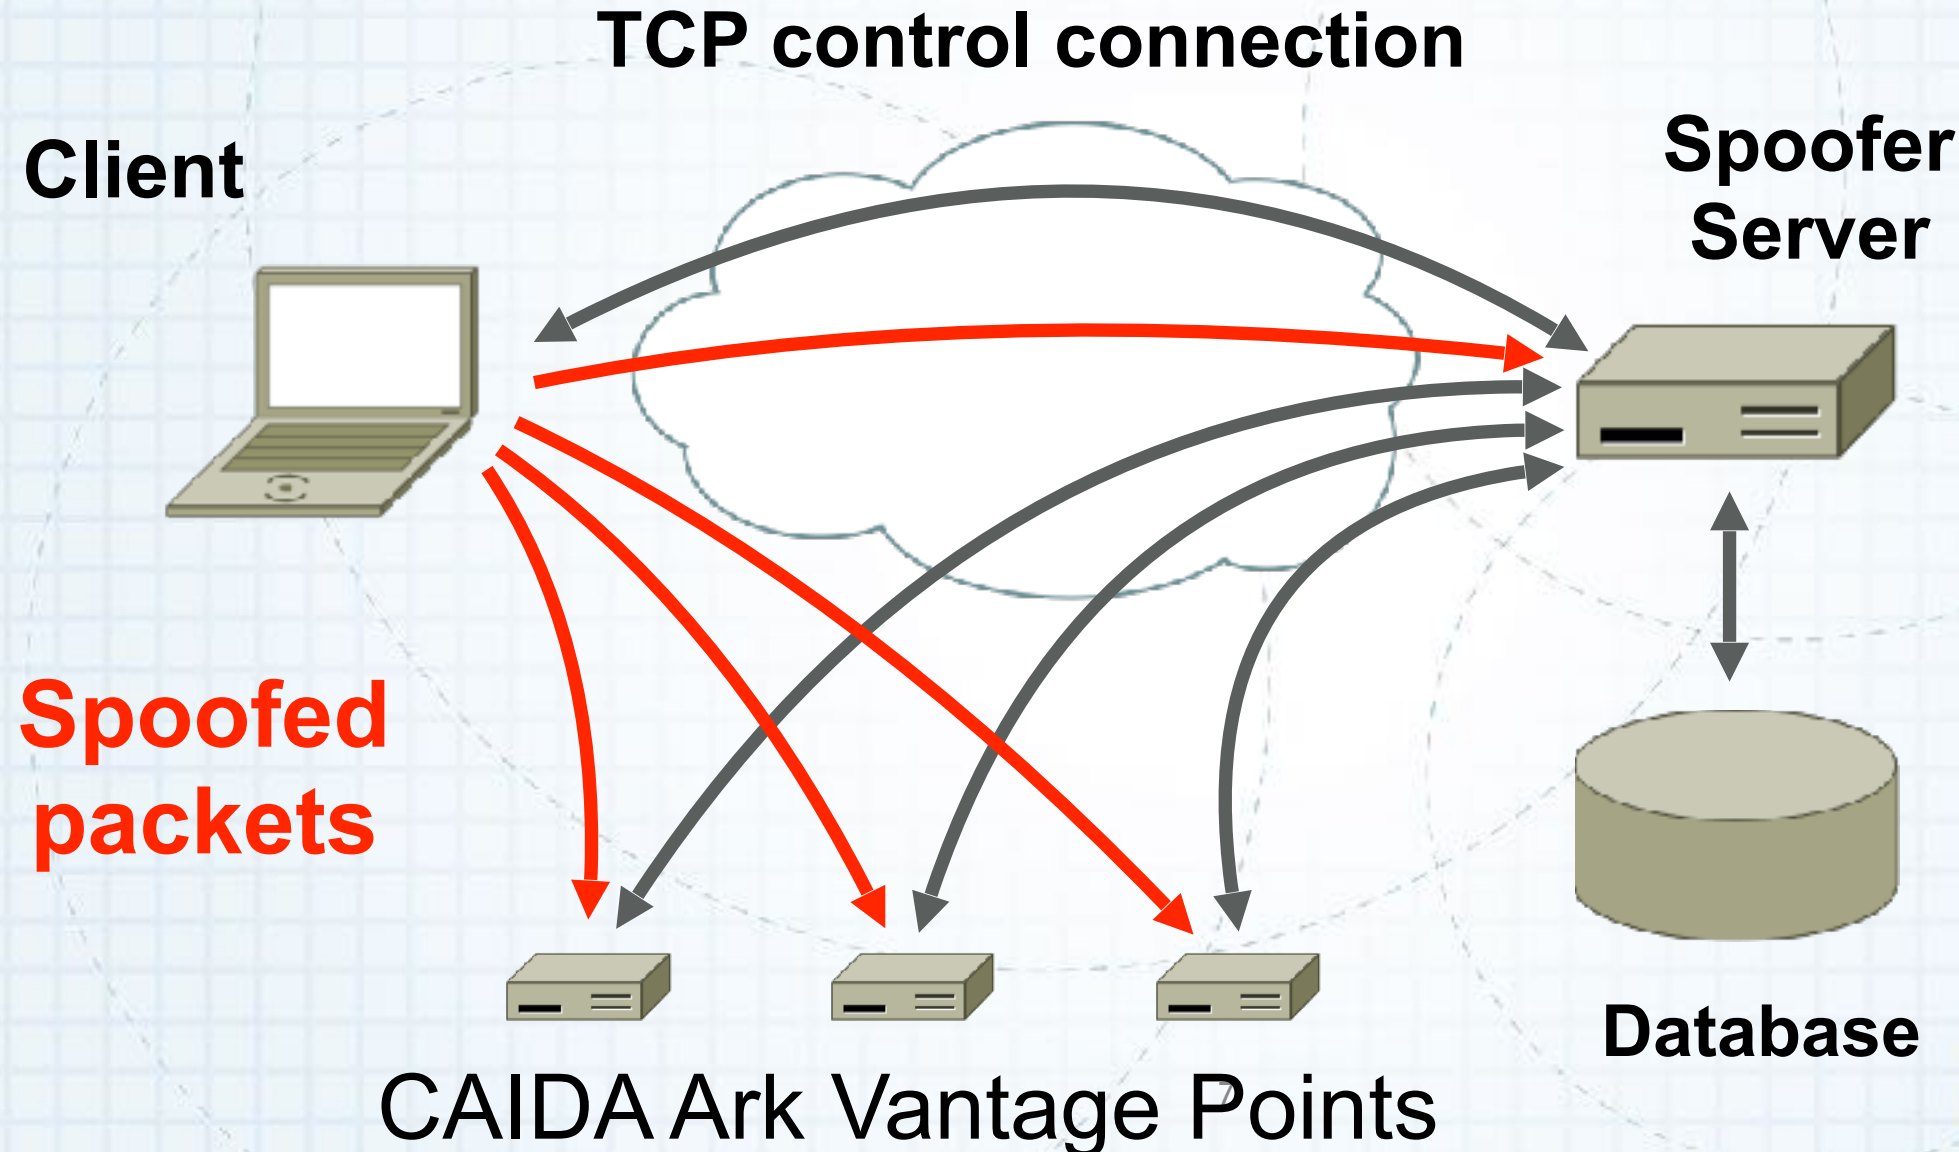

# Existing “solutions” to spoofing

- **BCP38**: Network ingress filtering: defeating denial of service attacks which employ IP Source Address Spoofing
  - <https://tools.ietf.org/html/bcp38> (May 2000)
- **BCP84**: Ingress filtering for multi-homed networks
  - <https://tools.ietf.org/html/bcp84> (March 2004)
- Not always straightforward to deploy “source address validation” (SAV): BCP84 provides advice how to deploy.

# Tragedy of the Commons

- Deploying source address validation is **primarily for the benefit of other networks. Incentive not clear for many networks.**
  - majority of networks do seem to deploy filtering. *But, no public data that allows a network to show that they have (or have not) deployed filtering!*
  - filtering gives an operator moral high-ground to pressure other networks to deploy, which does benefit the operator
  - “Cyber Insurance” takes into account security practice of the network: [QuadMetrics.com](https://www.quadmetrics.com)
- ISOC [RoutingManifesto.org](https://www.isoc.org/manifesto): Mutually Agreed Norms for Routing Security (MANRS)

# Spoofers: Client/Server Architecture

# Spoofers: New Features

- **Client/Server** system provides new useful features
  - by default publish **anonymized** results, and by default share **un anonymized** results for remediation
  - Runs in background, automatically testing new networks the host is attached to, once per week, IPv4 and IPv6
  - GUI to browse test results from your host, and schedule tests
  - Speed improvements through parallelized probing

[https://spoofer.caida.org/recent\\_tests.php](https://spoofer.caida.org/recent_tests.php)

# Spoofers: New Features

- **Reporting Engine** publicly shows outcomes of sharable tests
  - Allows users to select outcomes
    - **per country**: which networks in a country need attention?
    - **per ASN**: which subnets need attention?
    - **per provider**: which of my BGP customers can spoof?
  - What address space does an AS announce, or could act as transit for?  
Is that address space stable?
    - Useful for deploying ACLs

# Client/Server Deployment

Since releasing new client in May 2016, huge jump in tests (yellow line)  
Benefit of system running in background

### IPv4 Spoofing over time (including NAT)

### IPv4 Spoofing over time (excluding NAT)

Lack of probes in 2011/2012/2014-2015 are due to hardware failure

Excluding NATed IPs gives a likely more accurate inference for percentage of networks that allow spoofing. (Most NATs suppress spoofing.)

# More unique IPv6 tests, lower rate of SAV filtering

# Reporting Engine: Recent Tests

NATs behave differently:  
Some may block spoofed traffic  
Some uselessly rewrite  
Some do not rewrite and pass spoofed packets

Mostly spoofable	10
Partly spoofable	14
Blocked	256

# Notifications and Remediation

- Currently, we (Matthew) send (semi-automated) notifications to abuse contacts of prefixes from which we received a spoofed packet.

[Webpages by Stuart Thomson, Waikato]

# Practicality of Ingress Access Lists

*ACLs are “the most bulletproof solution when done properly”, and the “best fit ... when the configuration is not too dynamic, .. if the number of used prefixes is low”. - BCP84*

During 2015, ~5% and ~3% of ASes announced different IPv4 and IPv6 address space month-to-month, respectively.

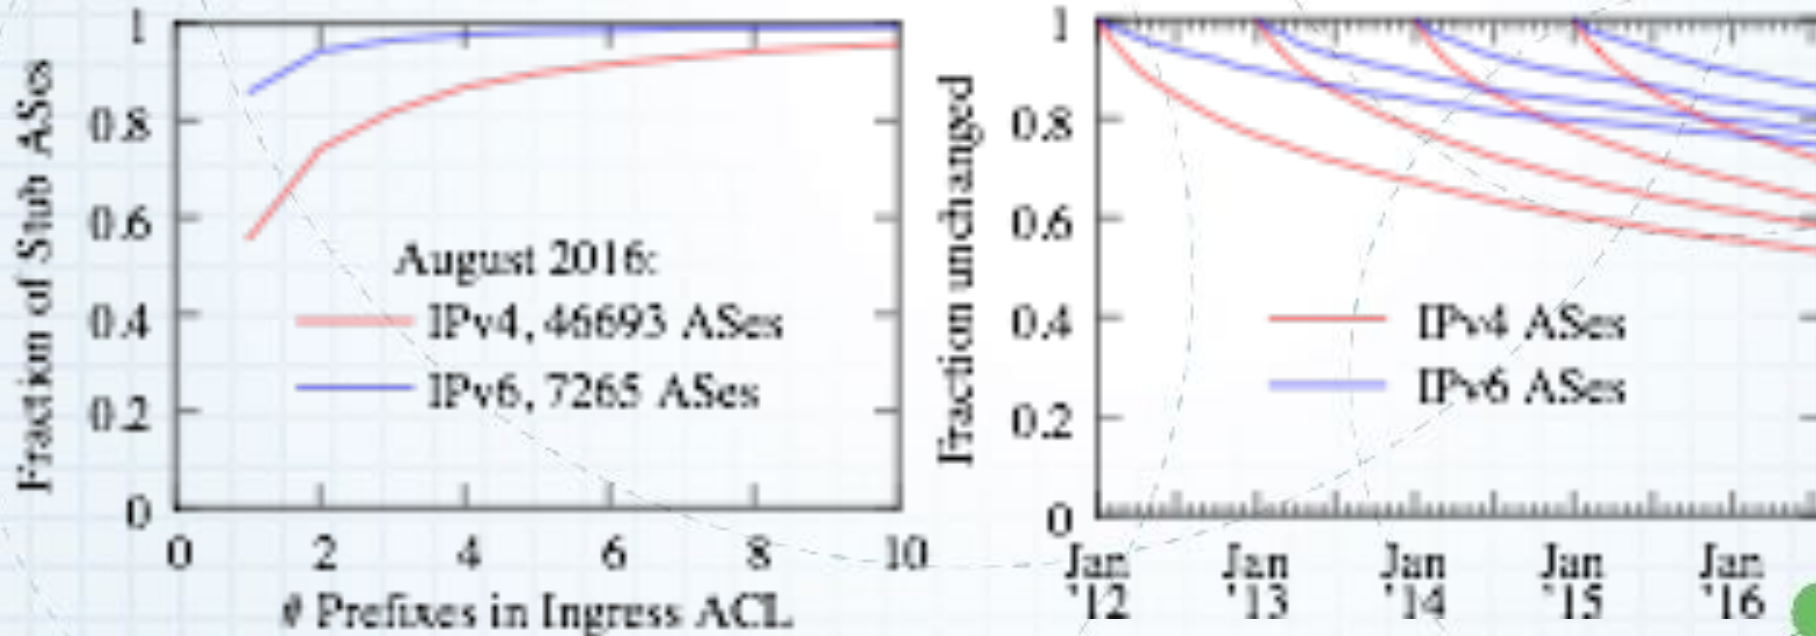

*Data Source: Routeviews and RIPE RIS data*

# Practicality of Ingress Access Lists

*ACLs are the “best fit ... when the configuration is not too dynamic,  
.. if the number of used prefixes is low”. - BCP84*

In August 2016, 86.9% of stub ASes would require an IPv4 ACL of no more than 4 prefixes. More than half of IPv4 ACLs defined in January 2012 would be the same today.

*Data Source: Routeviews and RIPE RIS data*

# Other Remediation Strategies

- **Enhanced data access to authorities**
  - All tests in given country, network (unanonimized)
- **Language translation of notifications**
  - Not in current DHS contract
  - ICANN helping with translation of notification language
- **Region-specific emails to operator mailing lists**
  - Have presented to NANOG, NZNOG, AusNOG meetings
  - Private notifications to all observably spoofing networks
  - Latest: region-specific network operator group focus

# Region-specific operator focus

In response to feedback from operational security communities, CAIDA's source address validation measurement project (<https://spoofer.caida.org>) is automatically generating monthly reports of ASes originating prefixes in BGP for systems from which we received packets with a spoofed source address. We are publishing these reports to network and security operations lists in order to ensure this information reaches operational contacts in these ASes.

This report summarises tests conducted within usa, can.

Inferred improvements during Mar 2018:

ASN Name	First-Fixed
11232 MIDCO-NET	2018-03-28
40801 LEWISU-ROME0VILLE	2018-03-28
33651 CMCS	2018-03-29
7018 ATT-INTERNET4	2018-03-31

Further information for the inferred remediation is available at: <https://spoofer.caida.org/remedy.php>

Source Address Validation issues inferred during Mar 2018:

ASN Name	First-Spoofed	Last-Spoofed
577 BACOM	2016-03-09	2018-03-31
7029 WINDSTREAM	2016-06-21	2018-03-20
209 CENTURYLINK-US-LEGACY-QWEST	2016-08-16	2018-03-25
11232 MIDCO-NET	2016-09-22	2018-03-24
20412 CLARITY-TELECOM	2016-09-30	2018-03-31
6181 FUSE-NET	2016-10-10	2018-03-25
62482 AS-LRCOMM	2016-10-21	2018-03-07
15305 SYRINGANETWORKS	2016-10-21	2018-03-28
25787 ROWE-NETWORKS	2016-10-21	2018-03-30
174 COGENT-174	2016-10-21	2018-03-28
271 BCNET-AS	2016-10-24	2018-03-23
32440 LONI	2016-11-03	2018-03-29
33182 DIMENOC	2016-11-08	2018-03-28
12083 WOW-INTERNET	2016-11-09	2018-03-29
5056 AUREON-5056	2016-11-10	2018-03-30

First auto-generated email to NANOG this week

Will send region-specific recent-test data to operational mailing lists, every month

# Current Status

- **Period I: Applied Research and Development (8 months, August 1, 2015 - March 31, 2016) - [completed](#)**
- **Period II: Development (12 months, April 1, 2016 - March 31, 2017) - [completed](#)**
- **Period III: Development and Technology Demonstration (16 months, April 1, 2017 - July 31, 2018)**
  - **Task 1: Refine client-server SAV testing technology and reports according to experiences and feedback, with continuing releases as necessary**
  - **Task 2: Develop software client for deployment in resource-constrained open-source home routers**

# Milestones and Deliverables (Period III)

- **Updated reporting system includes information about clients receiving spoofed packets**
- **Released software tool to measure ISP SAV deployment and identify a lack of ingress filtering by providers**

# Lessons Learned

- 1) Remediation is a hard problem to solve
  - Rarely do we get to interact with someone to whom we send a notification
- 2) Tests are still more sparse than we expected
  - Not common to have multiple tests from same prefix
- 3) Lack of peer pressure (or other incentives) contributes to problem
  - We gave talks at NANOG, NZNOG, etc.
  - Even networks stood up by operator groups (NANOG, IETF, RIPE) often do not have SAV configured properly  
[Kudos for RIPE's Oct. meeting network, no positive tests!]
- 4) Any step forward requires this sort of measurement

# Should I install the client?

- **Yes!**
- Room full of laptops and people who travel (use different networks). Great opportunity to collect new users and grow visibility of filtering deployment practice
