Internet through layer-3 glasses**

# Modeling of Internet Economics

Internet  Layer-3 model

Network

Autonomous System (AS)

Transit

Peering

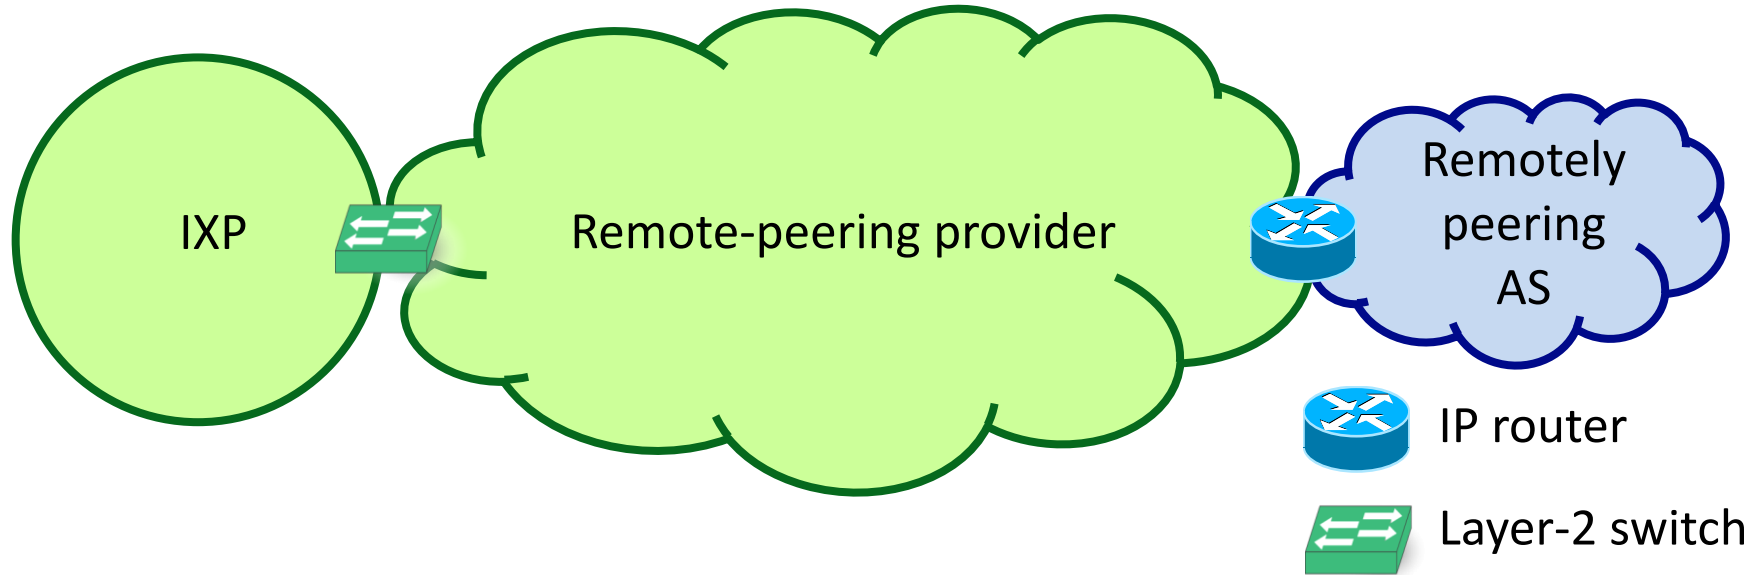

Interconnections between networks

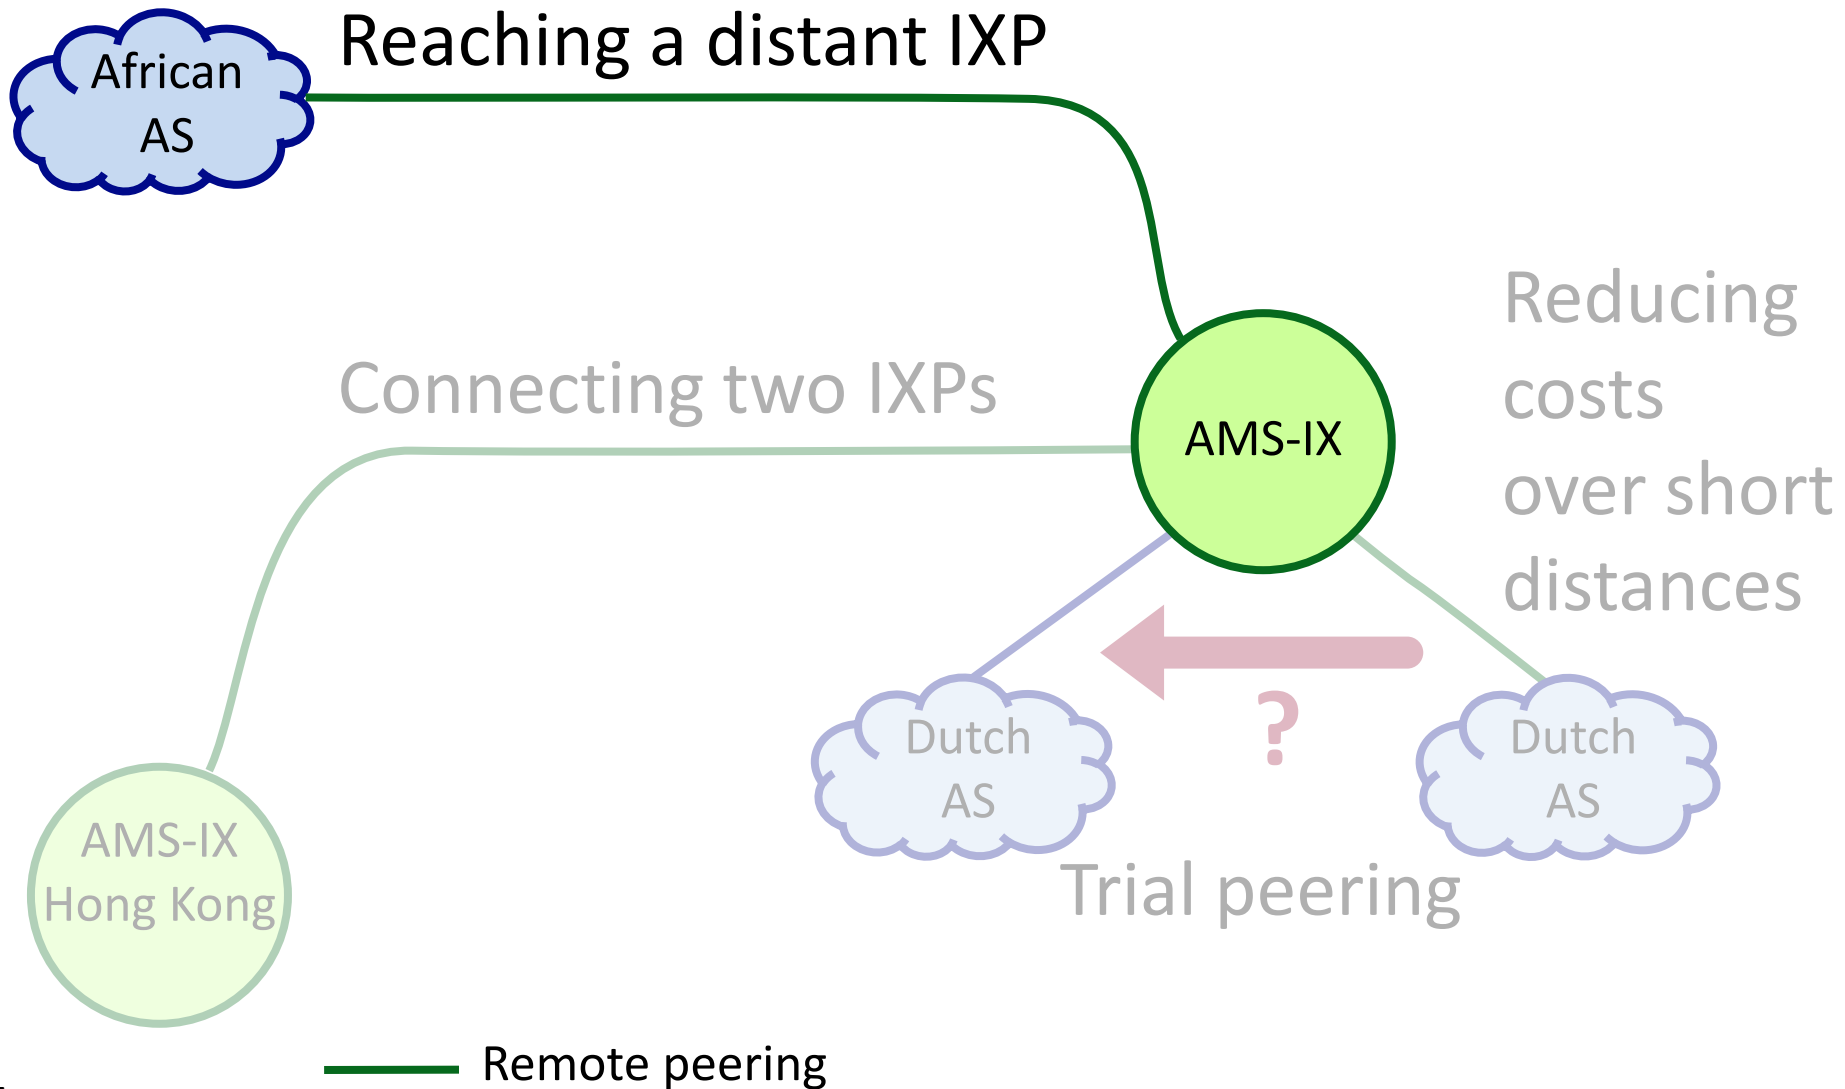

**Is there  
anything else?**

# Remote-Peering Providers

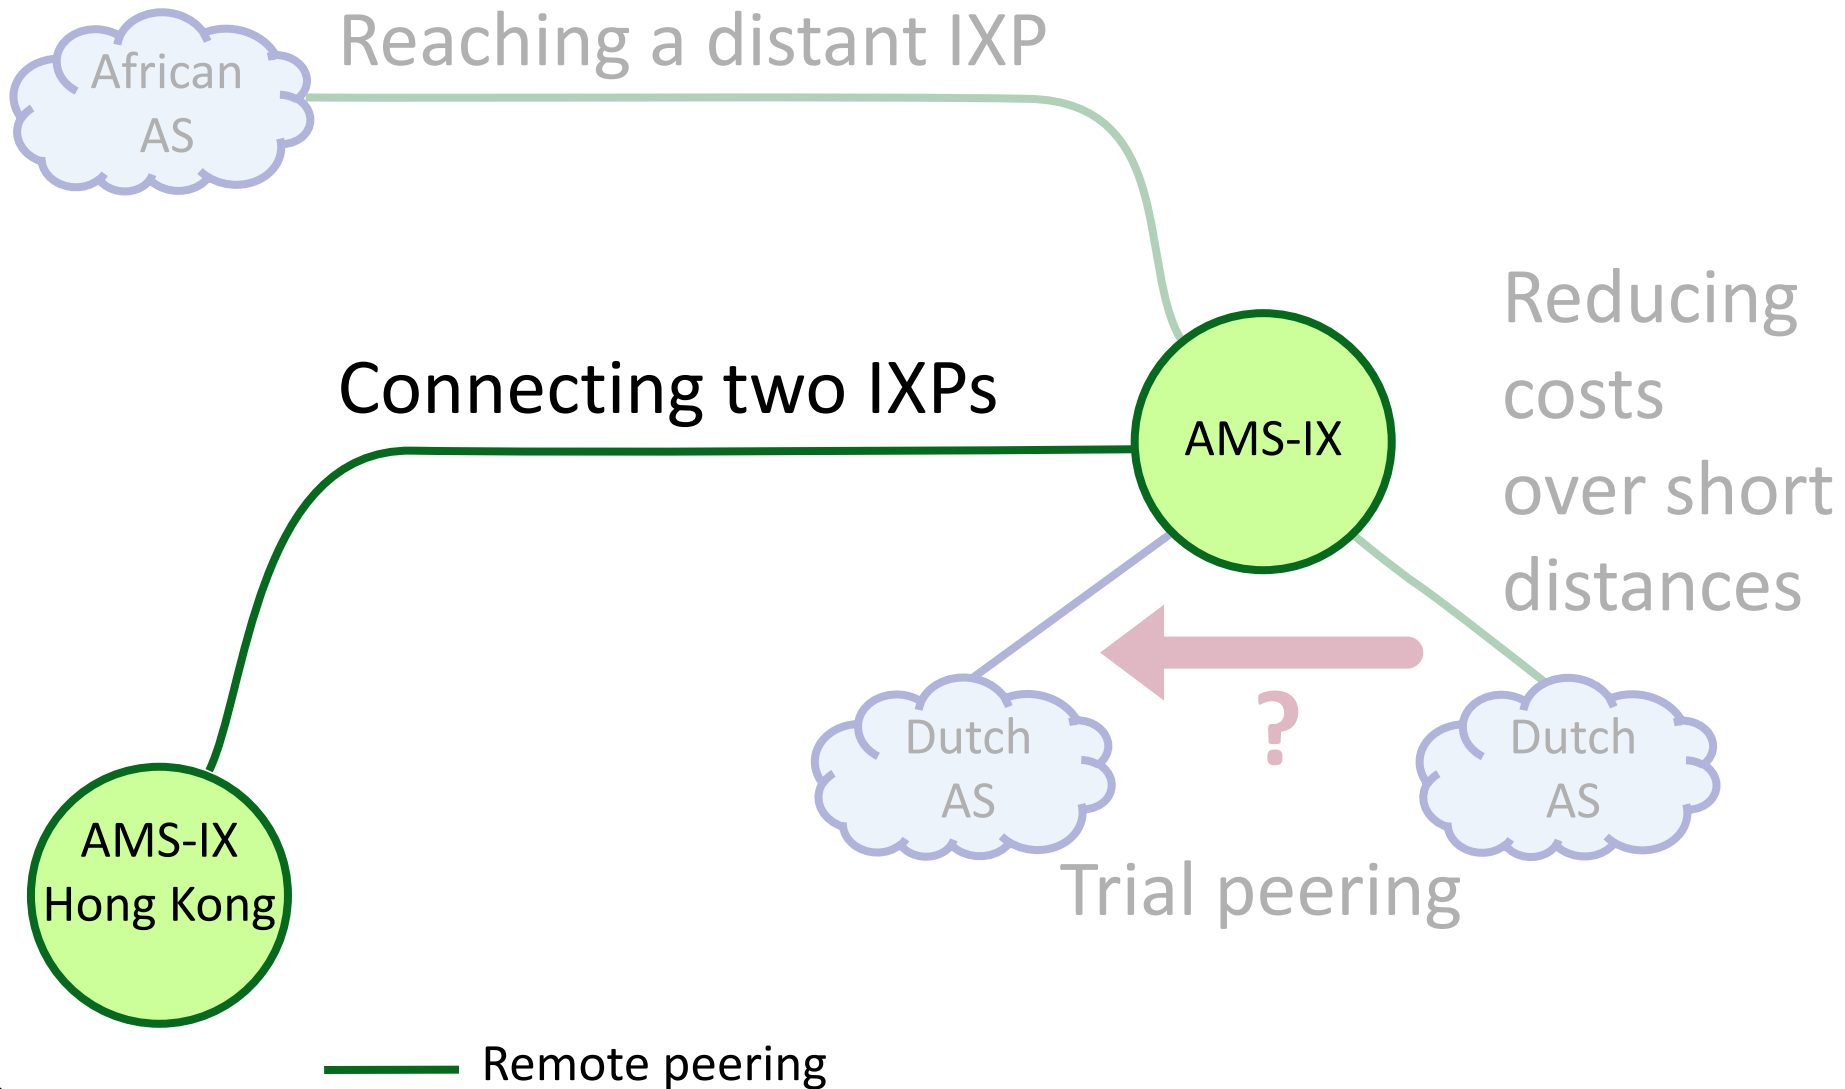

- Service components
  - Layer-2 connectivity of the AS to the IXP
  - Peering equipment at the IXP

# Usage of Remote Peering

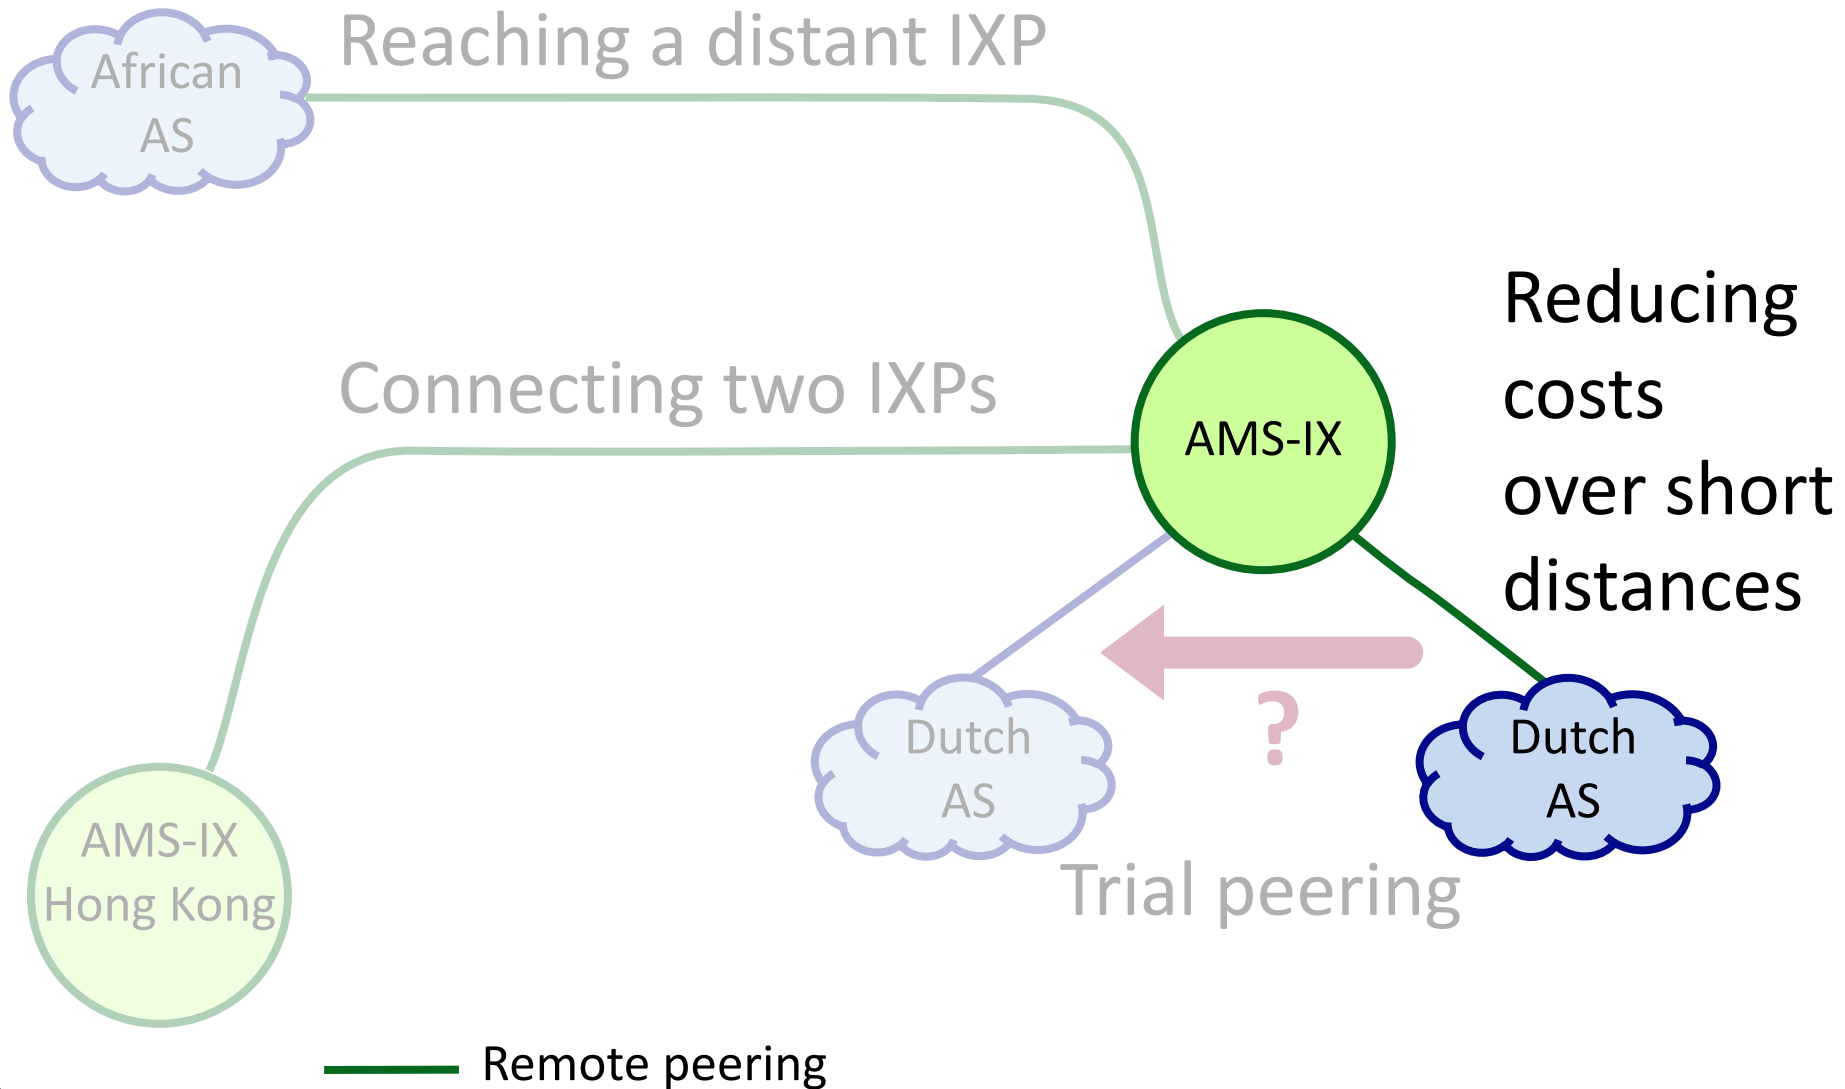

# Usage of Remote Peering

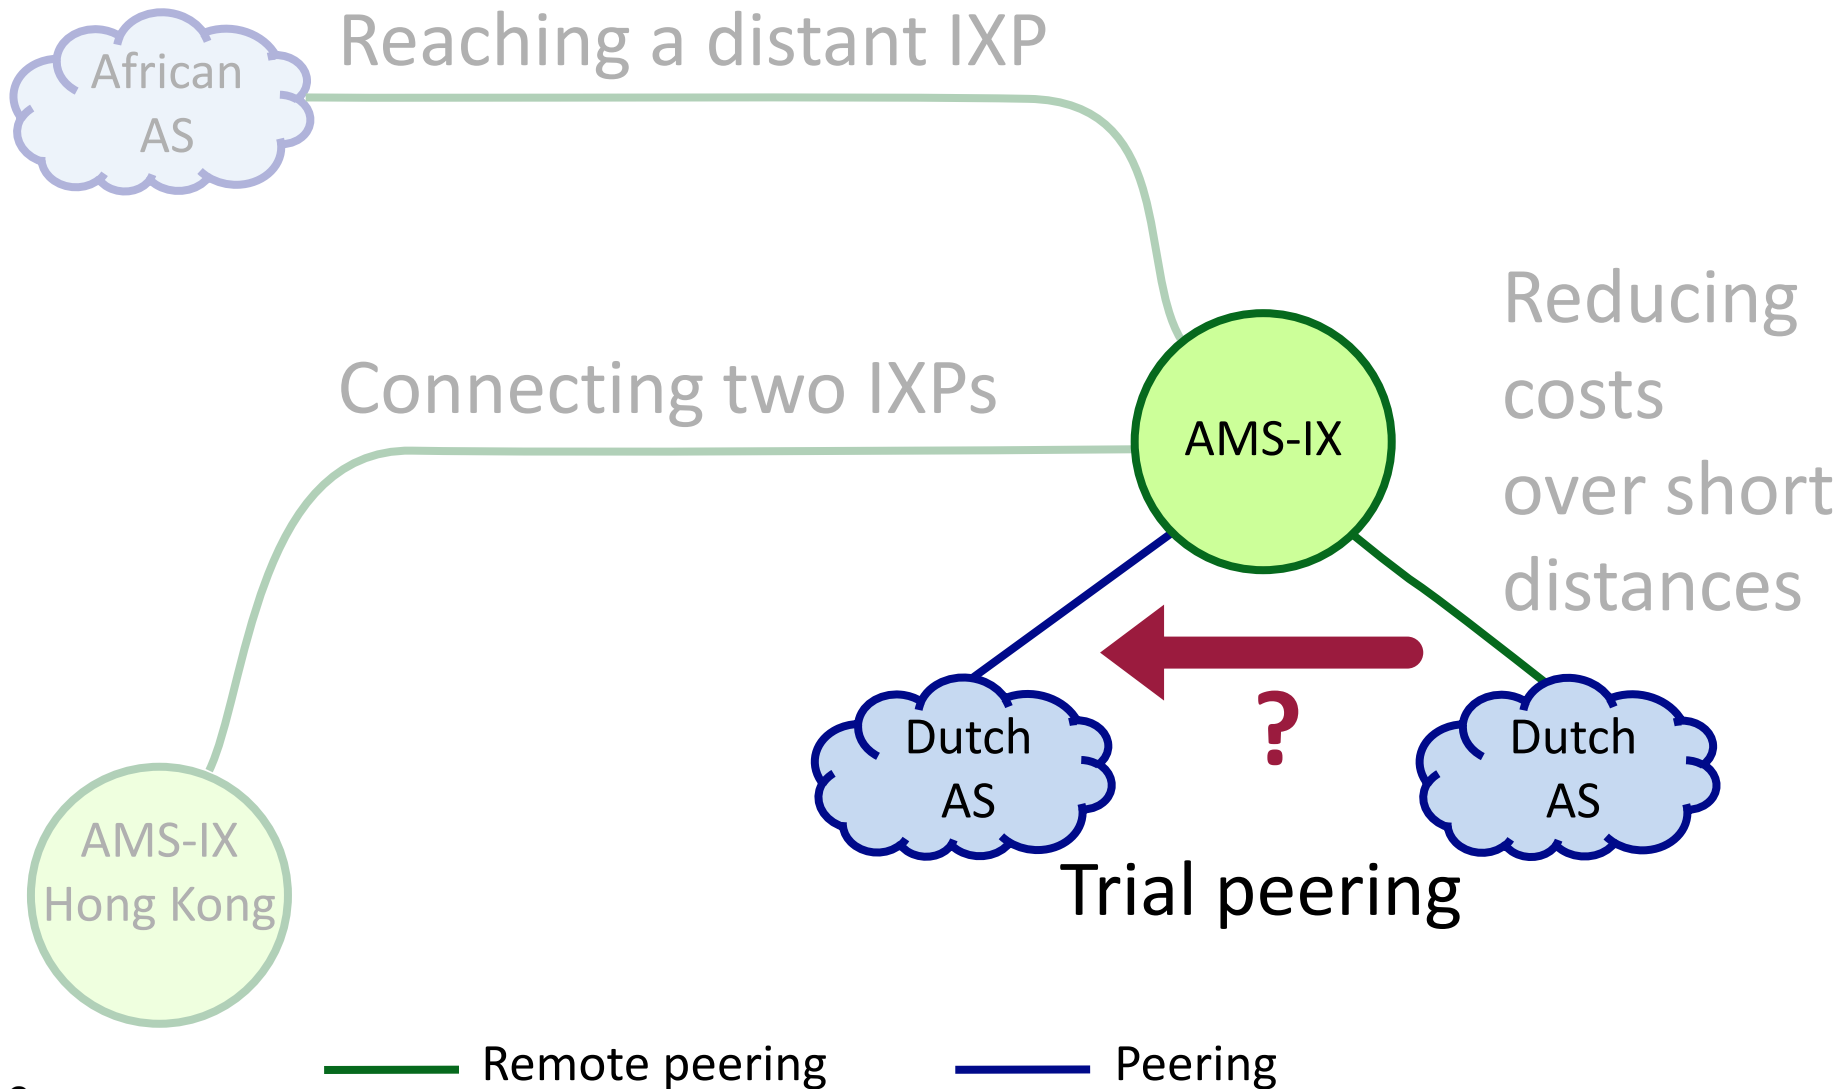

# Usage of Remote Peering

# Usage of Remote Peering

# Our Contributions

- **Measurement-based studies**
  - **Spread of remote peering**
  - Impact of remote peering on Internet traffic
- **Modeling of economic viability**
  - Remote peering vs. transit and direct peering

# Estimating the Spread

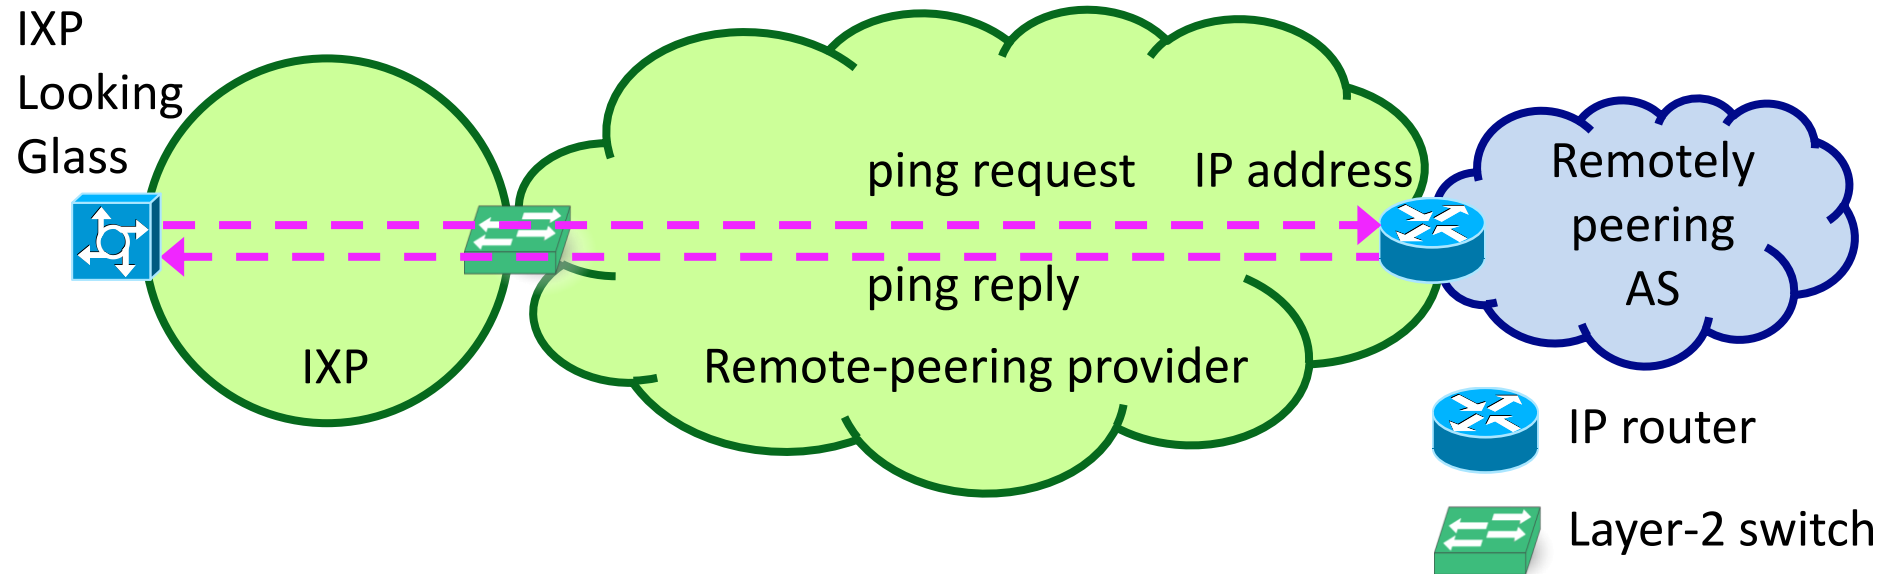

- Studied questions
  - How many IXPs have remote peering?
  - How many IXP members are remote peers?
- Approach
  - Conservative estimate
  - RTT (Round-Trip Time) as a metric of peer remoteness
  - 22 IXPs with colocated Looking Glass servers

# Classification of Peers as Remote

- IP address from PCH, PeeringDB, and IXPs websites
- Ping reply within one IP hop if its TTL = maximum TTL
- 4 months and 6 filters to get minimum RTT reliably
- If  $RTT > \text{threshold}$ , classify the peer as remote
  - Empirical threshold of 10 ms

# Validation

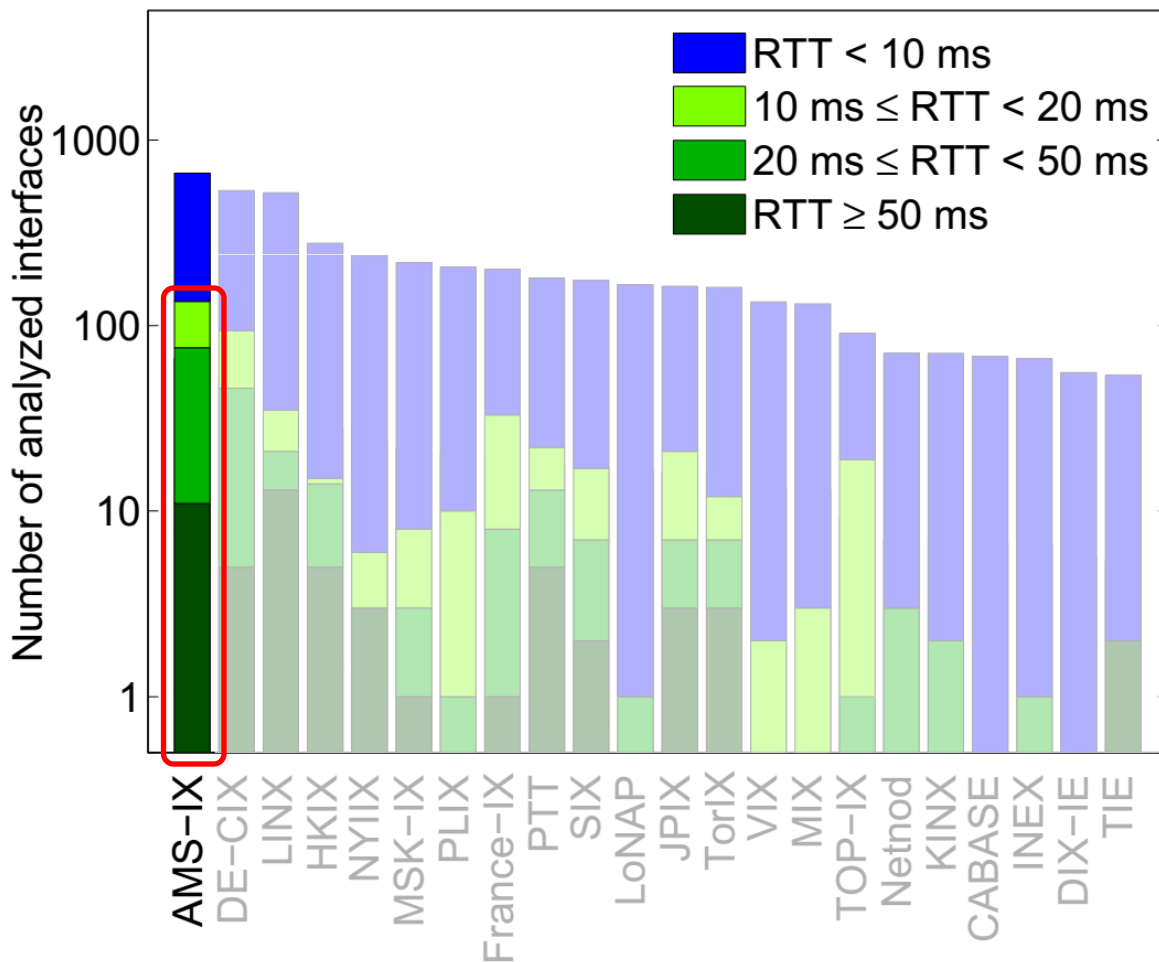

- Public IXP information on remote peers
- Ground truth from TorIX
  - RTT measurements
  - Remotely peering ASes

# Spread across IXPs

91% of the IXPs have remote peering

# Spread within IXPs

Around 20% of AMS-IX peers are remote

# Our Contributions

- **Measurement-based studies**
  - Spread of remote peering
  - **Impact of remote peering on Internet traffic**
- **Modeling of economic viability**
  - Remote peering vs. transit and direct peering

# Estimating the Offload Potential

- Studied questions
  - How can an AS benefit from remote peering?
  - How much traffic can the AS offload from its transit-provider links?
- Evaluated AS
  - RedIRIS, the Spanish national academic network
  - 1 month of NetFlow traffic data
  - Routing tables

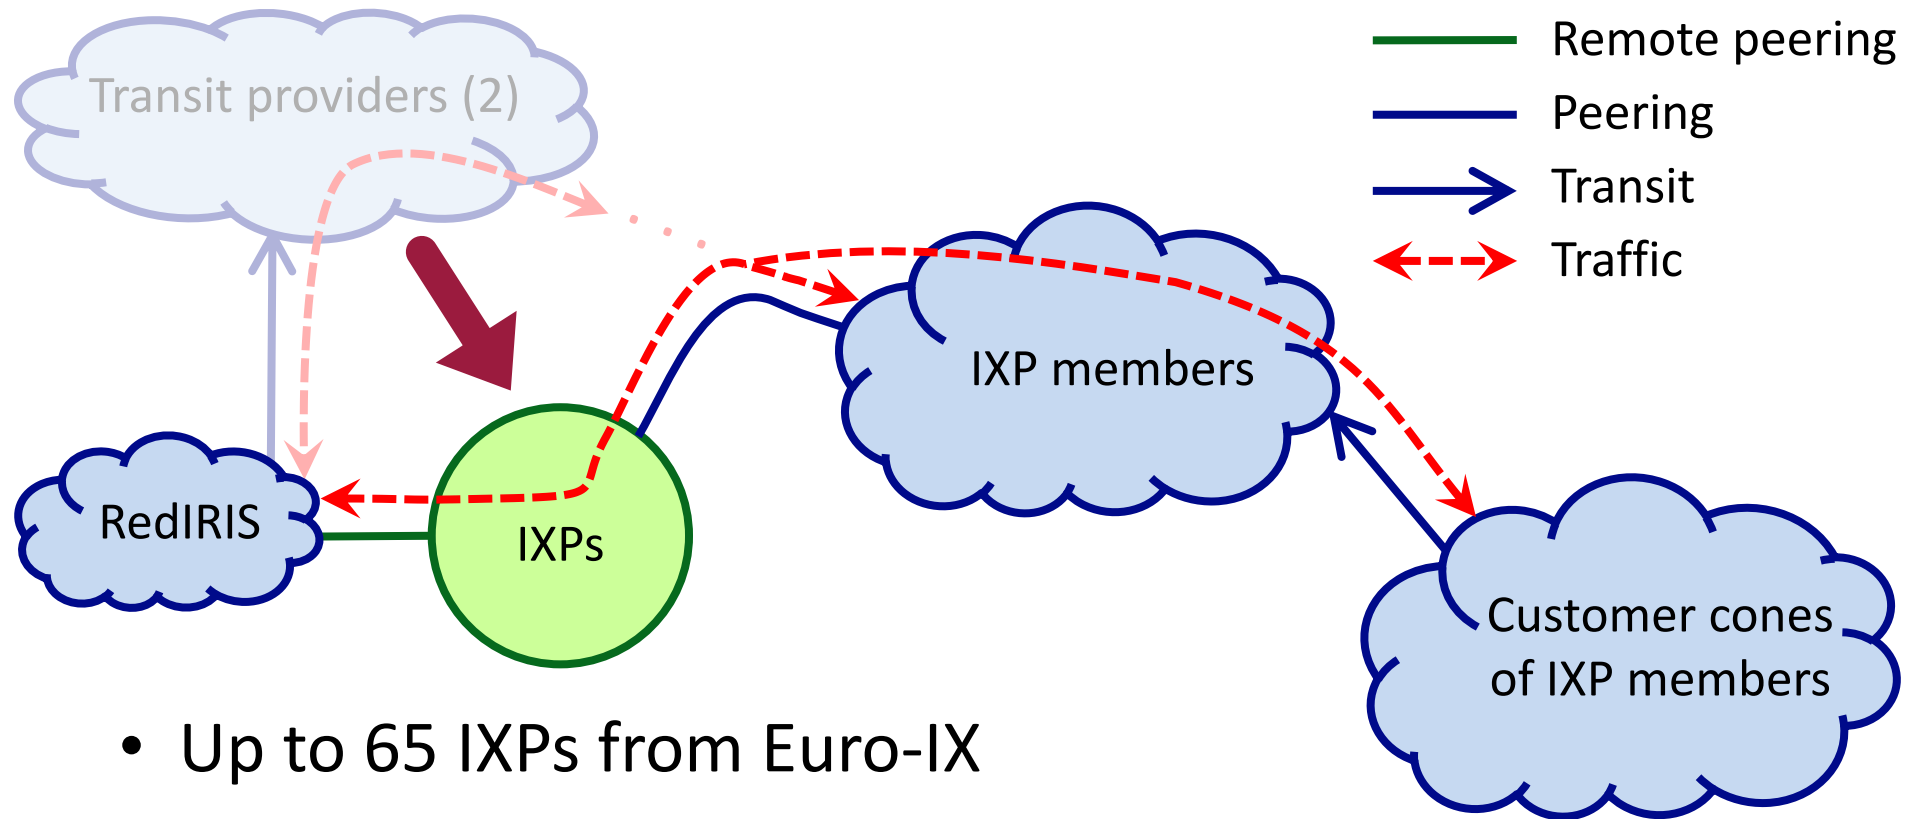

# Transit-Provider Traffic of RedIRIS

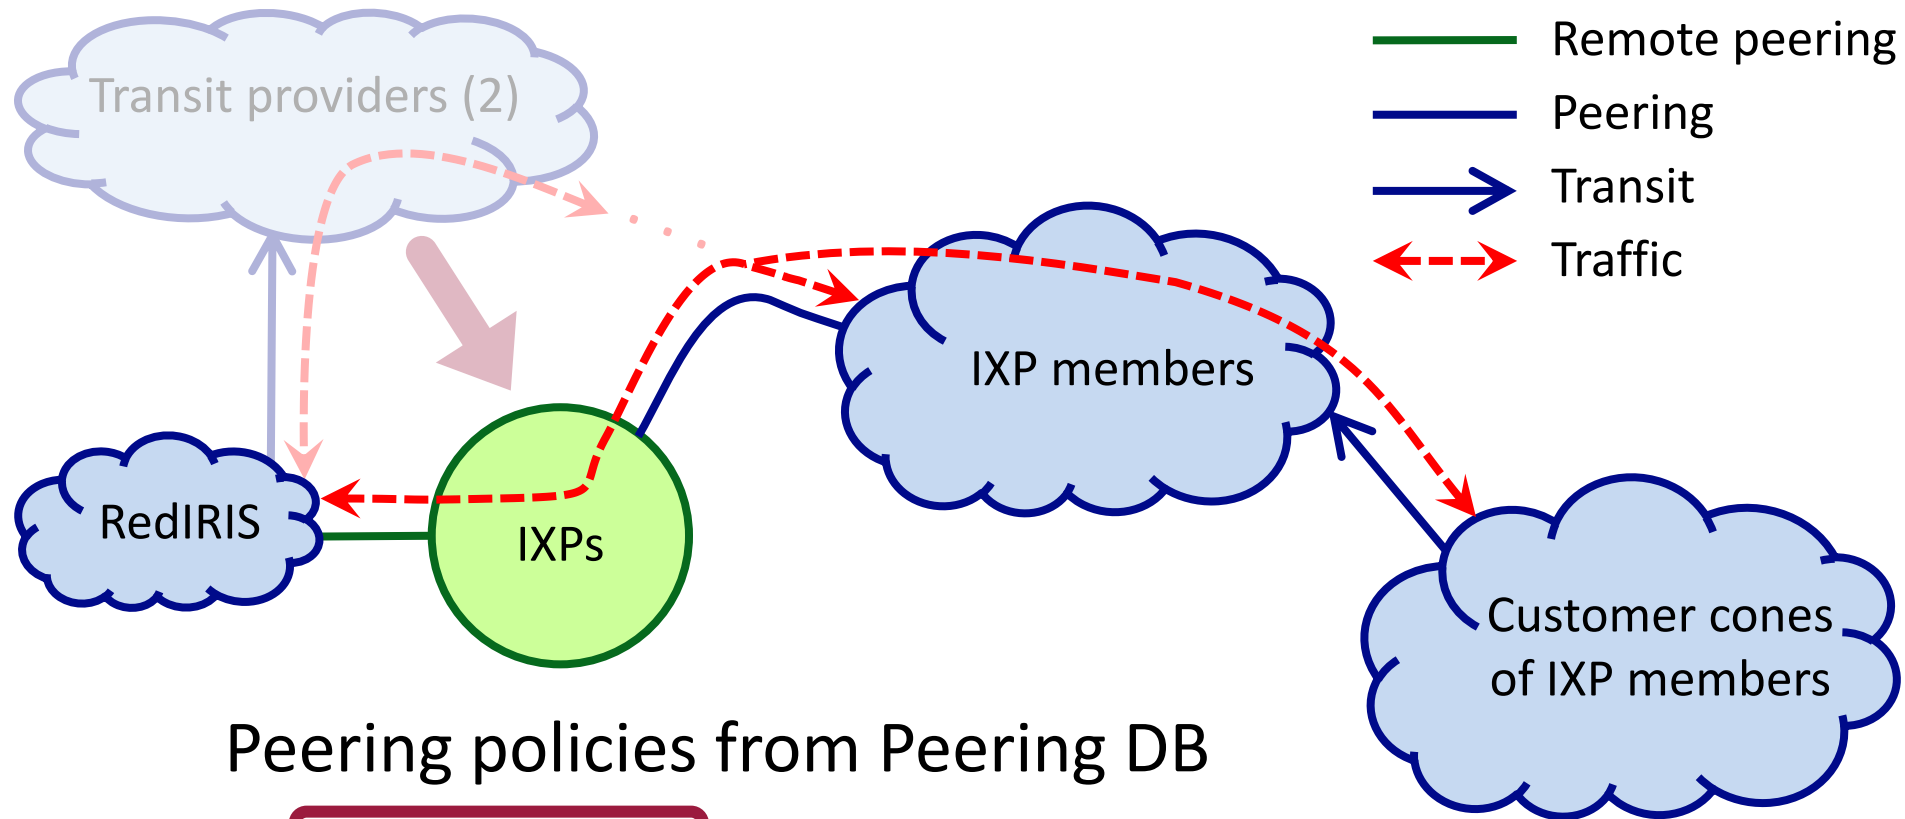

- 2 transit providers
- 29,570 ASes contribute transit traffic

# Choice of Reached IXPs

- Up to 65 IXPs from Euro-IX
- Reaching up to 12,238 ASes
  - Out of 29,570 ASes with RedIRIS transit traffic

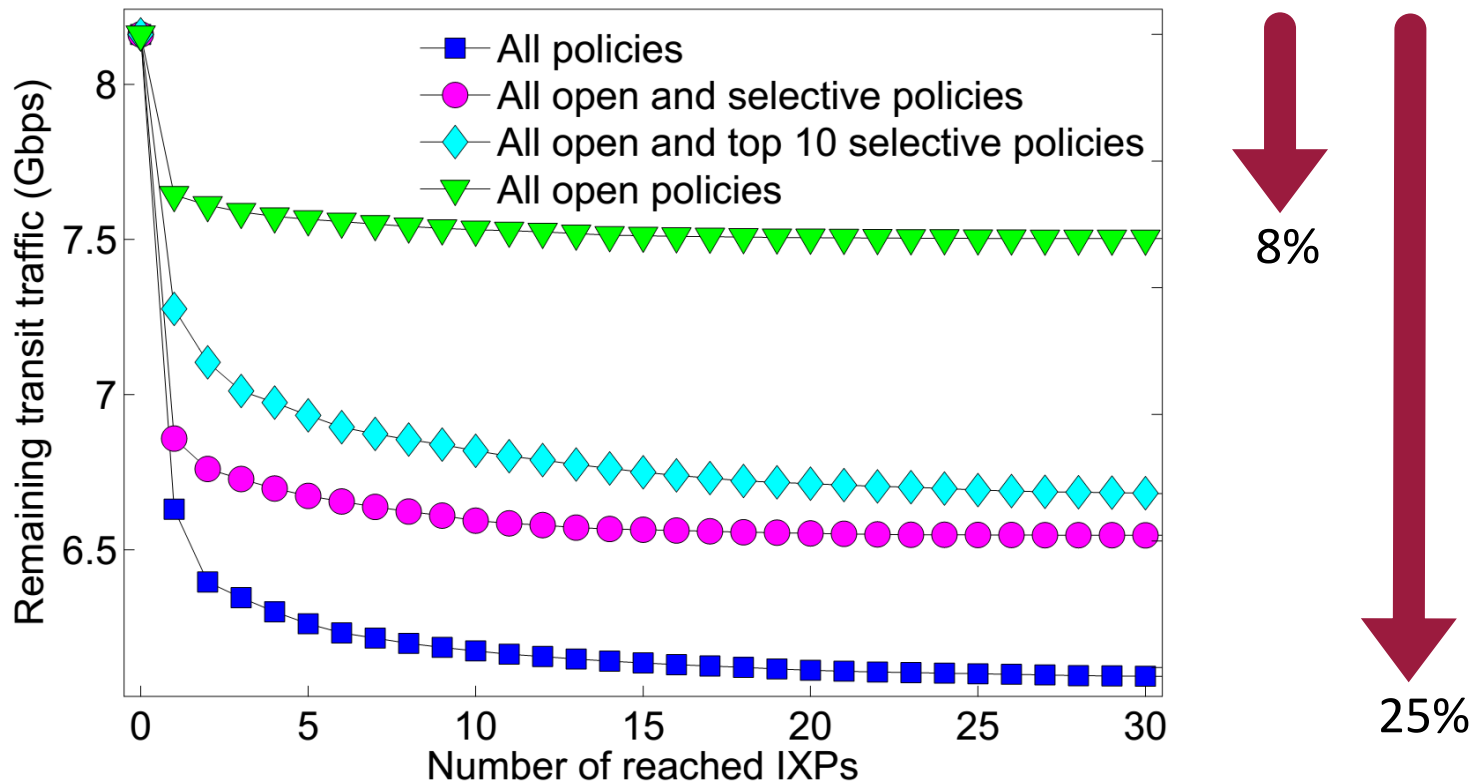

# Choice of Peers for RedIRIS

## Peering policies from Peering DB

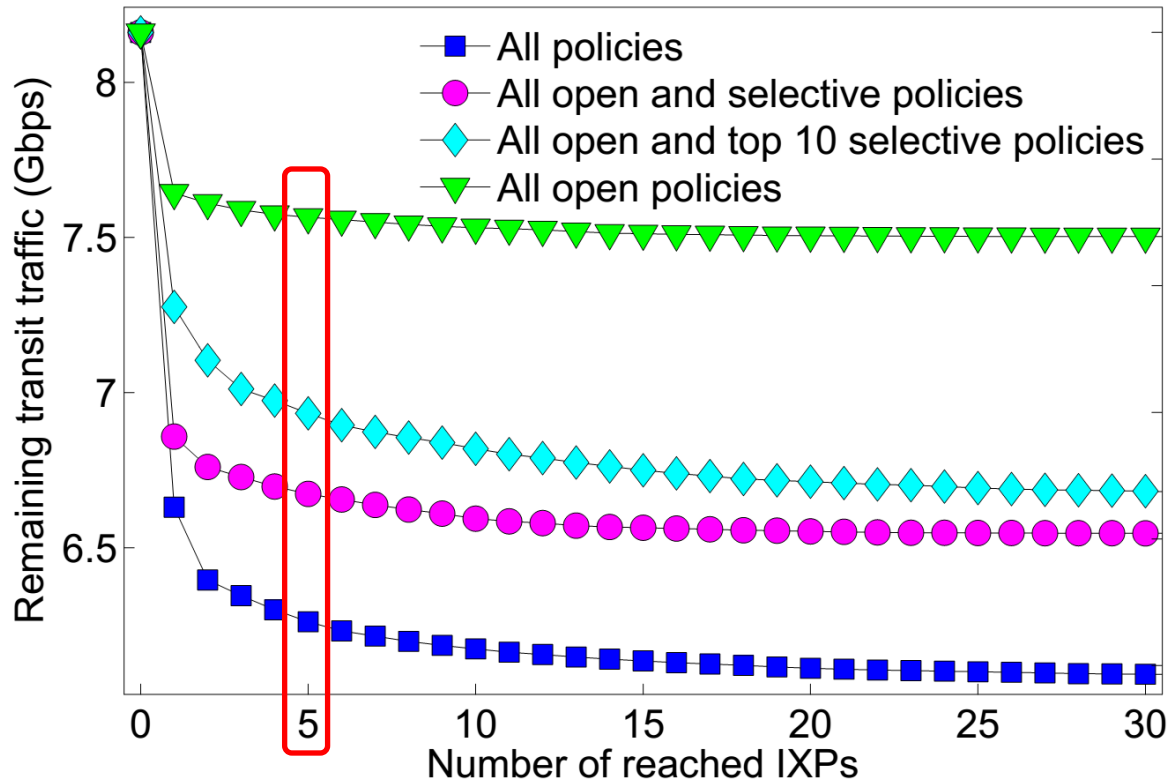

1. all open, ← lower bound
2. all open and top 10 selective,
3. all open and selective,
4. all policies ← upper bound

# How Much Traffic can RedIRIS Offload?

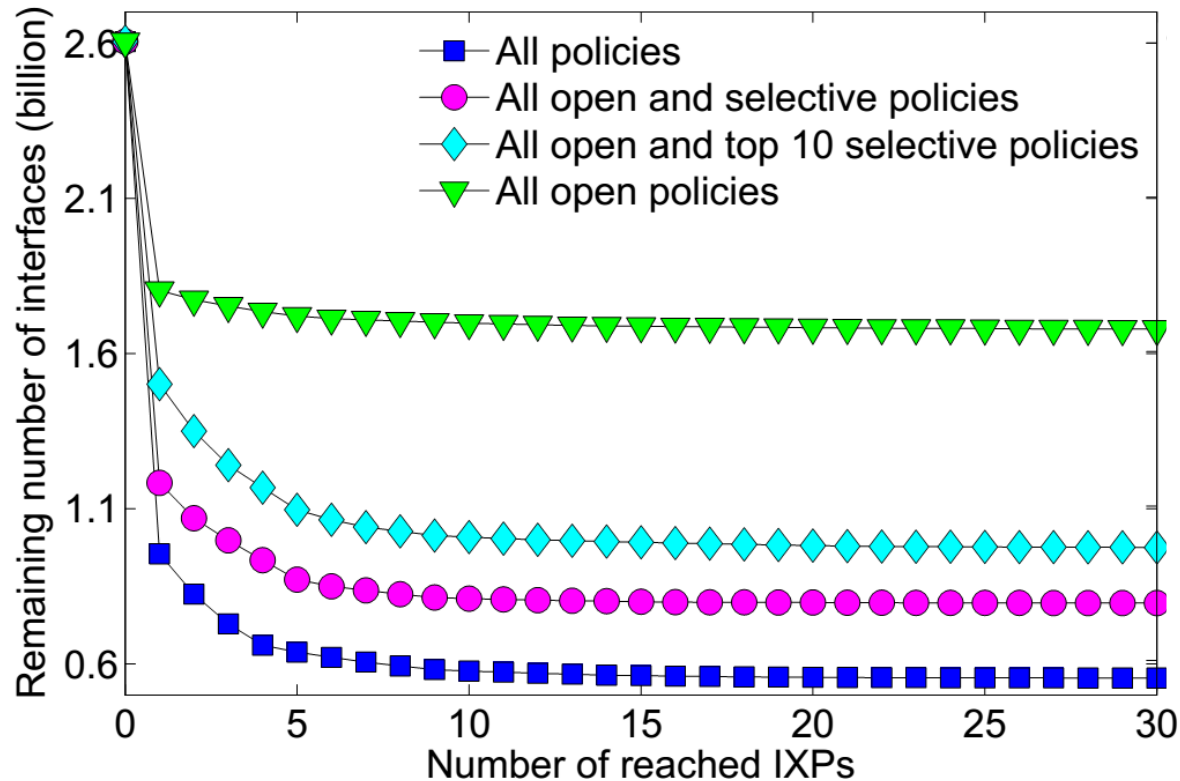

Between 8% and 25% of reduction in transit traffic

# Utility of Reaching an Additional IXP

Reaching only 5 IXPs realizes most of the offload potential

# Is the RedIRIS Case Representative?

Decreasing marginal utility of reaching an additional IXP is a general property

# Conclusions

- Remote peering, a **new common interconnection**
  - AS reaches and peers at IXP via a layer-2 provider
- Potential **impact on Internet traffic** is substantial
  - Reaching only 5 IXPs realizes most of the potential
- Internet economic **structure needs refined models**
  - Layer-2 entities need to be represented
